I guess you could put just about anything together and get some kind of result :)

I don't have access to the ARRL and QST articles mentioned in your post and other replies to this thread. But I assume one of the reasons for leaving the oscillator running is to reduce the frequency drift while transmitting code. The crystal is being driven quite hard, and at 6 meters and above, the self-heating may cause quite a large frequency shift. This is difficult to copy.

In this day and age, where frequency stability is good enough to use SSB at 1.8 GHz, people may not want to put in the effort to listen, especially when you are running QRP. Probably, any contacts would be very short!

> 1) There is a general lack of good design work across the world and
across the whole range of amateur radio. Editors of every periodical I know in
the US, UK, and everywhere else, are actively seeking anything even vaguely
publishable. There may be no alternative but to decide on a few deeply needed
projects and to commission some good quality design work. Perhaps some design
competitions could help to stir up activity?
>The amount of homebrewing seems to have both shrunk and focussed on the really
easy things. There are still some outstanding things being done, but they has
become much rarer.
>
>
I doubt that in it's entirety. There's plenty of good design work being done,
some very esoteric. The non-authors have become much wiser and realized that
the fame and fortune of being an author for either RSGB or the League
(addressing the un-repeated part of this thread) is neither worth the pain and
agony of dealing with the editors and sub-editors and sub-sub editors and the
draftspersons who have no idea how they're screwing up the offering, nor the
meager financial rewards.

HAH! I can just see either of the little publishing houses mentioned
"commissioning" an research project and article. Much too interested in trying
to keep their respective heads above water after years of poor management and
poorer decision making have ruined their market.

Homebrewing hasn't shrunk, we've just found out how to communicate our thoughts
and experiments with neither the need of a "National Rag" nor of consuming
large chunks of a magazine that doesn't have anything of interest. Both of
these entities and a couple of others not mentioned are obsolete. Your "design
competition" had better have something in it besides the "privelege" of being
published, or you'll throw a party and no one will come.

Speaking as a free-lance writer, I can attest that the amateur radio
market doesn't
pay well for project-based manuscripts-- $50.00 per page appears
typical. That's
not much of a payback when you consider the amount of work that goes
into creation of a
well-designed and well-documented technical project.

Also, one major amateur radio publisher pays its writers from six to
nine months after
publication-- and then only after the writer pleads for payment. This
attitude
discourages professional and semiprofessional writers from sinking time
and effort
into elaborate projects.

From the publisher's viewpoint, amateur radio doesn't offer the payback
from advertisers
that computer systems/hardware/software categories do. Today, most
magazines subsist
on ad revenues-- not subscribers-- hence the failures of interesting
mags like our late
and much-lamented "Ham Radio" and "Hambrew" magazines.

My guess is that amateur radio will continue as a niche market for
publishers unless
or until some event sparks greater public recognition and participation,

followed
by more demand for equipment, more ad revenues, and more competition
among publishers.

Until then, if you decide to design and write about your latest
amateur-radio project, do so because you want to contribute your ideas
to the
amateur radio community and advancement of the state of the art.

>mvdamme@xs4all.nl

How about building one of your own?
Here's what I did while I was messing around in the shack today, I built up a real simple and easy VLF converter.
I went through my junk box and found a Mini Circuits Lab SBL-1 mixer. Then I went through some old junk 386 motherboards. I found a TTL clock oscillator on 50MHZ. I hooked up the two components to make a receive convertor. I have a 6mtr all mode so I used that for my I.F. radio. After soldering the mess up, I hooked it up to the all mode and threw a hunk of wire out on the ground.
Did it work? Sure did, just as I knew it was supposed to.
Was it as sensitive as my Kenwood TS440s on VLF? No but I didn't expect it to either. The converter has NO RF amplification, it's just "brute force" conversion. I did have some interference from the broadcast band but don't forget there was no filtering either. The 50mhz oscillator puts out square waves so there was some (not much) "hash" on the signals. Tuning around I could hear LORAN C and I heard numerous navigation beacons. The 6mtr all mode has a 4 MHZ bandwidth so I was also able to copy the AM broadcast band, 160mtrs, 75mtrs and everything in between. 0-4 mhz!
So add some filtering and some amplification and it don't come any easier than that. You can even use the same basic setup, turn it around and use it for transmit. Good use for that 10 meter all mode sitting around. Just pick the proper oscillator freq for the radio you're going to use.
None of this is my own idea but I thought I'd pass it along. I just put it together to see how good it would be.

73 and good luck,
Jon...WS1K...

hello there,
Yes yes, it's the wrong newsgroup, but please hear me out before you start to write someting.
I'm an animation student and I am writing a paper on "adults and animation". At the moment I am trying to do some research and that's why I need your answer on these small questions.
Please e-mail me the answer because this message was posted to really a lot of newsgroups. You will find my e-mail adress at the bottom of the page.
Thank you very much for answering, and please don't even think about sending me something else than the answers, I won't take the time to read it anyway.
Brecht Cuppens

1 Which factors do you find most important in an animated movie, series, short,.....(choose three and rate, 1 being the most important, 3 the least)

1humor
2story
3visual style
4music
5Technique (3-d, cells, computer...)
6atmosphere (dark, heavy, comic, weird,....)
7dialogue
8quality of animation
9"adult content"(violence, sex, drugs,...)
10suspence
11realism
12subjects
13other (fill in)

2Which is your favourite animated movie, series, short,.....(only one please) and why?(choose from the above list)

3some personal info: age, sex , education, country

My answer would look like this:
1visual style
2storie
3humor
The Nightmare before christmas: visual style, quality of animation
20/m/university equal education(not finished yet)/Belgium

This shouldn't take too long and I kept it as short as I could,
so if you feel like it, you know what to do
thanks

```
FCC Enacts Internet Morse Code Requirement
--- ------ -------- ----- ---- -----------

The FCC, under pressure to clean up the Internet, especially after the
Communications Decency Act provisions regarding Internet content
regulation were stricken as violating the U.S. Constitution, has
decided instead to require a Morse code requirement for Internet
users. Citing the success of the Amateur Radio Service and the general
belief that its requirement for operators to pass a Morse code
proficiency exam and other technical requirements, has kept the A.R.S.
"clean", the FCC will enact a 5 word-per-minute requirement for all
Internet users. They are leaving open the issue of whether there
should be a "codeless" class of Internet user and are soliciting
comments on this proposal.

Persons wishing to develop a web site having only links to other web
sites having links to other web sites, and so forth, must pass a 13
word-per-minute test and demonstrate proficiency in HTML, the Internet
authoring language.

Persons wishing to develop web sites that have actual content, as
compared to just links to other web sites, must pass a 20
word-per-minute Morse proficiency test, demonstrate proficiency in
HTML and the Java programming language, and show that they have
mastery of at least one human language, such as English.

The FCC, which lacks budgetary authority to implement the testing
program, has stated that it intends to create Volunteer Examiner
programs for Internet applicants.

## 4585. Difference between torroid or air wound?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-18 00:00:00 UTC
From: Tim <Hynde@flash.net>
Message-ID: <3472710F.5A19@flash.net>
Source record: 89066

I see schematics now and then calling for lets say a 8uh coil,
X number of turns on a T-50-6 or a T37-2 etc. If the coil required for
the circuit is truly 8uh does it matter if I use the torroid?

The equivallent coil would be wound on a pencil or something handy using
the standard coil formulas.

Tim

I do not promote using the TR7 on 11M. For those hams who don't have AUX7, and want the WARC bands, clipping one wire will do it. The Tx will be enabled 1.8 - 30 Mhz.

I don't think that a pencil will give you quite the same Q as a nice
Amidon toroid core. :-)

The other key advantage a toroid gives you is the fact that it's
self-shielding to a large extent. That can simplify circuit layout
quite a bit.

I wouldn't recommend substituting a non-toroidal inductor for a toroidal
one.

Whoa! One of the best gags in years!!!!
Lesseee,the Amateur Radio Service is "clean,and a success??" GARBAGE!
This is not an idle claim,let's fire up our radios and listen.What do we have here? Ummmmmm,Twenty meters during the weekend.....Gee,sounds a whole lot like what I hear on cb 19.....Lets spin the dial down to Eighty meters.Listen to some of these guys say F*ck this,S*it that...Hey! thats not allowed!!! I don't understand,they are using their callsigns! Why does this happen? Why does this continue?Because the "clean and success" line is is bogus.

GRay

For the homebrewers out there (or restorers):
I think I might have run across the perfect coil form to wind coils on: Plastic hair curlers. They come in a variety of diameters (as small as 3/16 inch), and are quite "airy" (they remind me of the minimal Air Dux forms).

The ones I have passed the microwave test (didn't heat up when bombarded with microwave oven RF).

Best of all, they're free for many of us... ("Honey, I'm missing some hair curlers!" "Oh, the cat was chewing on a few of them so I threw them out...")

73,
Jeff KH2PZ / KH6

P.S. ("Honey, we don't own a cat.")

Tim,
John has given you some basis for not trying to do it as an air core.
Here are some more things to be aware of:.

It's very difficult to get the amount of inductance you want and at
the same time keep the resistance down. The more wire and the finer it
is, the more resistance. That's what he means by the Q - you can't get
the high ratio of inductance to resistance with an air core.

If you didn't care so much about Q, you might have to worry about self
resonant frequency.. When you wind a lot of wire onto a small form,
you will likely develop some significant capacitance distributed
across the turns. This will cause the inductor to begin to look more
like a parallel resonant circuit at some frequency. If that frequency
is near or below the frequency where you are using the inductor, it
may not behave as an inductance - it might even look like a
capacitance if you get high enough in frequency.

One way to minimize that effect is to wind the inductor in separate
pi's, as is usually done with RF chokes. That kind of winding is very
specialized and is difficult to do by hand.

It may be possible to subsitute something for the toroid. Almost any
ferrite will give you a higher inductance than an air core. If you're

lucky, you might find something near to your needs by purchasing the inductor assortment kit at Radio Shack.

Quite often a designer specifies a part from the perspective of simply documenting what he used. That has the advantage of ensuring that someone else can duplicate his circuit and get the same performance. However, in many cases the designer COULD have used quite a range of components or values in a given circuit with equal or nearly equal results. Therefore, there are often cases where you can make clever substitutions. There is no guarantee as to what the designer really had in mind unless he provides a detailed circuit analysis (rare).

I think that SOMEONE should point out that there IS NO channel 83 in the UHF TV allocation any more; channels 71-83 were reallocated to cellular telephones some time back. You do NOT want to put a television transmitter anywhere in this band.

Hello all,

I was interested in this thread and I started to do some investigation regarding these connectors. Being in the two-way radio business in South Africa, I managed to find a source of these connectors.

Unfortunately I have to purchase in lots of 100, with a minimum order of 100 units.

Each unit comprises one moulded plastic plug and six pins. There is no cable connected.

The cost of 100 units is $525-00 excluding postages to the United States.

If anyone is interested, please send me an e-mail.

Regards,

Marc ZS6HZ

# 4601. Broadband transformer

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-19 00:00:00 UTC
From: Marc Vissers <mvissers@glo.be>
Message-ID: <64u8t5$a69$1@rhea.glo.be>
Source record: 88984

Hello,

Our shortwave listeners club and I are having a DX-weekend here this saturday and sunday in Belgium and since some computers are involved this time, I would like to use a broadband transformer to shield the longwire antenna's feeding line. The commercial types are too expensive in my opinion (about 70 dollars) and since I have an old Fritzel FD-3 Windom antenna balun left over, I thought I could convert this one into a 9:1 broadband transformer (unbalanced to unbalanced, 450 to 50 ohms). I have seen a schematic in an older ARRL Handbook with 4 bifilar windings and would like to use that. I don't know what type of core it is (might be Amidon T-130 or something), but would like to know how much turns I have to use or how to check this (don't have much equipment though).

Maybe better would be a 10 to 1 transformer for a longwire, but I don't have any schemes of such a circuit. Does someone here has a better or other practical scheme that he can send me (scanned copy as a jpeg ?), so that I can make this thing work before friday ;-)

Thanks very much in advance. Hope someone here can help me as quickly as possible.

73, Marc

There are several things which could make your pencil-wound coil different than the one wound on the toroid.

First, because of the shape itself, toroids have a much lower external field than solenoidal inductors. So your pencil-wound inductor will couple a lot more to nearby objects, including wires, PC board runs, and other inductors. It will also be more affected by vibration and proximity to large conductors such as shields and ground planes.

Second, the pencil-wound inductor may have a lower Q (or, it could be higher in some cases). If the application is a VFO inductor, a lower Q will cause more drift. If in a narrow filter, the filter will be broader, and have less steep skirts and more insertion loss. If in a power application, it will get warmer.

Third, the pencil-wound inductor will have a different self-resonant frequency and different stray capacitance. So when measured at any frequency, the apparent inductance will be different from the toroid.

On the good side, your air-wound inductor won't saturate if it has to stand a lot of DC current. If not designed for the current, a toroid or any other inductor wound on a magnetic material might saturate.

Any or all of these effects may be negligible. Or may be important. It depends on the application.

Of all the electrical components, a good argument can be made that inductors are farthest from being ideal. Much more than just the inductance of a real inductor is often important and has to be considered.

the formulas for air wound coils are easy to understand and use. Is the same
true for toroids? How do you use a box full of junk toroid forms? How do you
do the calculations?

continue to be a license requirement.

>so tough to learn,

The degree of difficulty is not the issue at all.

>so out dated

It is certainly out dated as it's use has now down to only
a recreational aspect (QSOs, DX, contests, etc.) within the
ham ranks only. Even in the ham ranks it serves no
purpose at all in emergency preparedness and or any
actual safety or distress operations.

and so
>completely useless,

It isn't useless (procode red herring again) it has its
proponents and users, but none of the uses suffice any
longer to mandate the separate pass/fail test element that
code contines to have. Yes, there's a treaty requirement
today, but that is met completely by a 5wpm test for
now and there's no additional treaty elements that
require 13 or 20wpm testing.

>as many no coders continuously whine,

Again, many (most?) of us that are championing
the end of code testing are NOT nocoders, but rather
coded hams who have already passed various levels of
code testing.

>why do I see
>the majority of qsl cards for CW qsos? I presort cards for the W1 QSL
>bureau. Better than 75% are for CW contacts. Somebody better get a
>clue here.

What's the point? QSL cards are just the exchange of record for
a contact. It isn't the USE of CW that we oppose, it is the
mandated test requirement that is wrong for the license
testing today. If, as you note, most QSL exchanging is for
CW contacts then I see no reason to think

that continued use of CW will end IF code testing
ends. Indeed, if DX continues to be the interest area
it always has been, then there will continue to be new
devotees to CW for that reason alone. Having said that,
I'll repeat again that DXing is not a reason that justifies
mandated CW testing today.

Our amateur radio group has just acquired an IFR Systems spectrum analyzer model A-7550.

Unfortunately, during the self-test routine on power up, a 'Fail' appears pertaining to the RF test. We suspect the front end was overloaded with too much power while testing a transmitter. Does anyone know where we should look to repair the damage? A few helpful hints, a block diagram or even a schematic of that portion of the equipment would be helpful. We will gladly pay for any photocoping costs, postage etc. We can be reached at:

e-mail: sortinc@geocities.com
packet radio ve3flk@ve3ksq#swon.on.ca.na

Thank you in advance for any assistance you can give us!

Well, what you propose can be done, but I seriously question whether
it is worth the effort. A regular ASCII terminal can be had virtually
for the asking, and using a computer instead of a terminal has a
number of benefits. In fact I'd suggest that a better approach would
be to discard the idea of terminal and TNC altogether and simply let
a computer handle everything in software.

But if you are bound to attempt your approach, you're going to have to
do ASCII-EBCDIC and EBCDIC-ASCII as well as dealing with a terminal
intended to operate in page mode. Probably the best way to do that is
with a single chip microcontroller rather than a pure hardware
serial-parallel-code conversion-parallel-serial lashup that will still
have to somehow fool the terminal. A micro with enough spare memory
to do page mode emulation is what's needed, and that can handle the
code conversion as well. You might be able to do it with a PIC chip,
and you can certainly do it with an 8051 or a 68HC11.

You need to set yourself up to program one of these babies, and learn
its language if you don't know it already. All three companies offer
development kits for their chips which are quite reasonably priced.
I work with the 68HC11, but lots of people like the 8051, and the
PIC family has a strong following too. You need to browse the
manufacturers' web sites and see what strikes your fancy, and
make a commitment to one of them (or to some other chip, those
aren't your only choices, though they are probably the most popular).

>I second that. All those in favor?

Let's just modify it a tad. How about we change it from codeless
to clueless? As a result, you should turn in your newsreader
immediately.

>Hey - if morse code is so bad,

Few have said it's "so bad". It just isn't the be all end all of
communications as it was 50-70 years ago.

>so tough to learn,

So is the theory, but I don't hear anyone complaining about it
because the rationale for it as a requirement is spelled out
in Part 97.

> so out dated

Well that it is.

> and so completely useless,

Again, few if anyone has said that. It's simply no more important
than any other aspect or mode in amateur radio.

> as many no coders continuously whine,

The only whining I see is from clueless folks that can't even understand
the issue isn't about Morse Code, but the requirement for
demonstrating its knowledge at higher and higher speeds to
access portions of the amateur spectrum. You might rent a
clue and check the call signs of most of those posting in favor
of change. You'll find that they have passed as many or more
Morse Code tests than your license class indicates you have.

>why do I see
>the majority of qsl cards for CW qsos? I presort cards for the W1 QSL
>bureau. Better than 75% are for CW contacts. Somebody better get a
>clue here.

Because DX chasers haven't discovered the latter half of the
20th century? No, just kidding. As an apparent wall paper chaser
yourself, you well know that it is an amusing activity to some and
many feel it is more sporting to do it the hard way. What any of
that has to do with licensing requirements is hard to imagine.
The clue you really need to rent though, is that no one cares
whether you find manual OOK Morse Code amusing and no one
is trying to prevent you from continuing to use it. The need for
Morse Code as a licensing requirement has long since disappeared.

>For those of you who will take exception to the "CW requirement" for the
>internet...Lighten up or get a life!

Why not have it as a requirement? After all, if you are going
to make arbitrary unrelated requirements for some activity, it's
about as valid as making Morse Code knowledge a requirement
to access amateur frequencies below 30 MHz.

>73 to all, even no-coders de W1AAE

73 to all, even the clueless,
Todd
N9MWB

PS This post has had its follow up line set to rec.radio.amateur.policy
as
I'm sure the other newsgroups have had their fill of this nonsense.
Please take the discussion over there.

# 4618. Re: Matching Sweep Tubes

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-19 00:00:00 UTC
From: res@cmprime.cis.att.com
Message-ID: <64vfu3$s6c@anchor.cis.att.com>
Source record: 89001

: Does anyone have any experience at matching sweep tubes. Can you describe the
: procedure that you have successfully used?

I am familiar with the procedure used at RL Drake to match their finals
in the '60s.

They put the tubes in a fixture that had some fixed bias on the grid
and probably proper voltage on screen and plates, and measured the
plate current. The tester marked the current reading on the
tube envelope. Typical numbers were 25 to 45. At 600 volts (if that
is what plate voltage was) of plate voltage 25 probably meant 25 ma.
of plate current, which would equate to 15 watts of dissipation.
And that is within the rating of the tube.

Then they put only tubes withthe same numbers in a rig. So, by their
definition "matched" meant within 5 ma of each other.

If you have a rig that you are matching for, why not do the same, using
one tube at a time?

Hello all!

30 Meters transmit for the FT-101EE

The first thing is of course to unplug the rig (G). I grin at this but
I've
been bitten a few times and this mod can bite if the rig is plugged in.
You will have to remove the entire case. IE the top, bottom and wrap case.
(I call the wrap case the case that is left after both the top and bottom
are
removed). With this rig this is pretty simple. After removing the case put
the
radio on it's back all modifications are on the bottom. (All refrences will
be
frm the rig on it's back and facing you) Then remove the cover from the
tuned
circuits. It will be the large cover on your left with a bunch of holes in
it
This will expose the tuned circuits. You will notice 3 circuit boards with
mucho trimmer capicitors and the bandswitch wafers. This is where all our
mods will be made.

From the factory the WWV position shares the 20 meter tuned circuits in
the receive end. We will be removing these jumpers and adding components
to giove 30 meters it's own tuned circuit in receive and transmit.

The first thing we need to do is get oriented. We will call the first circuit
board (nearest to you) PB-1 the next one PB-2 and the last one PB-3. Yeasu calls
then PB-1188, PB-1187A and PB-1092 respectivly. I like my names for
simplicity. Also I will be refering to the band switch wafers by letters
starting with the one nearest to you as A, the next one as B etc ending with
M. I guess this would be a good time to give you a parts list.
This is the parts list from the original article. Liberal substitutions from
your junk box is allowed, as a matter of fact my parts list just vaugely
resembles this. As long as you can get close on the capicitance you will be
OK.

T1 & 2 2 79pf Trimmers rated at 250V for PB-1 and 2
T3 1 40pf Trimmer rated at 500V for PB-3
C1 1 50pf Silver Mica cap for PB-1 rated at 250V
C2 1 68pf Silver Mica cap for PB-2 rated at 250V
C3 1 68pf Silver Mica cap for PB-3 rated at 500V

Let's get to work. The first thing is to remove the jumpers connecting the
WWV setting with 20 meters. You will need to remove the jumper on wafers C and
E.
C is no problem but E is kinda tight. I would recomend removing E at the 20
meter tab and extending the wire to our new capicitors we will be
installing.

Now we need to install our new capicitors for 10mhz. On PCB-1 the only place
I could find to put T1 and C1 was between the upper right hand cap and the
mounting screw. Install the caps in parallel with one leg at ground and the
other leg going to switch wafer C at the WWV position. Install TC2 and C2
on PB-2 as close to the left edge of the PB as possible the same way
except bring the other leg to the wire you have hanging off wafer E.
Install TC3 and C3 on PB-3 on the side closest to you between the 2 mounting
points for the cover for the tuned circuits in the same way. You will have
to run a wire from them to wafer switch G. It is kinda hard to get to and
deep but it is doable (If I can do it anybody can, I promise).

Now the fun part begins (G). For some reason Yeasu left out the tab on
Wafer l and we will need one here. I scrounged my junk box for a tab
that resembled the one they had used and found one that was close.
You will have to do the same. Cut the new tab very carefully from the old
switch with wire cutters and cut away the brad on one side. Then
Super glue the new tab in the proper position on wafer switch I. After
the glue has set attach a jumper from the tab to the 40 meter tab
(the next one to the right with the cloth cover). All we need to do

now is put a tap on the final tank circuit for our new band. Go to
wafer M. We will be putting a wire from the 30 meter position tab
to the pi tank coil. Remove the 2 inductors that are in the way and
attach a wire in-between the 20 meter and 40 meter taps. (This should
be just below the nut holding the bandswitch together). Run
this wire to the tab on wafer M. Reattach the 2 inductors.
Now drill holes in the cover in order to reach the trimmers and put
the cover back on.

Now for the aligment. The new band will have to be aligned.
Put the preselector at 4 on the dial (Not 4 O'Clock). Go to 10.000 mhz
and load it up into a dummy-load as well as you can (Remember to keep
your plate current below 200 ma).Don't be fooled by the noise at 10 on
the dial. It is a spur generated by the rig and if you load up on it it
could damage the rig. Adjust TC2 and TC3 for the highest power output.
Then turn on the calibrater and tune for a S-meter reading under 10 and
adjust TC1 for the best S-meter reading.

Now you can put the cover back on. You should have as good performance
on 30 meters as you have on any othe band.

I make no warrantys for this modification. If you mess your radio up it
is not my fault. I have done this mod and It works great on my radio.
I cannot say the same about yours. You do this at your own risk.

Next week I add 12 and 17 meters

Hello All!
Putting the FT-101EE on 17 and 12 meters

Ok folks here is the last installment of my series on adding the WARC
bands
to the Yeasu FT-101EE. The only parts you will need for this are as
follows.

1 Crystal cut for 30.520 Mhz (for 12 meters)
1 Crystal cut for 24.020 Mhz (for 17 meters)
I ordered both from International Crystal out of Oklahoma City. but there
are many sources for these.

1 DPDT 12v relays from Radio Shak
About a foot of hookup wire (22 gauge multi conductor).
A small experimenters circuit board form Radio Shack.
A good pair of wire cutters and a lot of patience. (workng room is a premium
on this mod)

Before cutting any wires I did some experimenting and found that the rig would tune up on 12 meters from the 10 meter position and tune up on 17 meters from the 15 meter position.

So how do we go about inserting 12 and 17 meters without sacrificing anything. I decide to move 28-28.8 mhz to the 10C position and use it's slot for 12 meters. Then move 28.5-29 mhz to the 10D position and use it's spot for 17 meters. Then build a switch (using the relay) to switch the 28 and 28.5 mhz crystals with the 29 and 29.5 crystals using the clarifer
switch (I like the idea of the LED and it reminds me of my old Kenwood 830).
Then replace the clarifier pot with a combination pot and pull on switch and
maybe a new LED for it. I have not completed the switch part of the mod but you
get the Idea. It will work. It is kinda involved, but this is the only way I could figure out how to do it. I'm sure someone else has done it differently.
(I thought of many different ways myself) but this is the way it worked for me.

First as in my last article have the radio on it's back and facing you with the case comepletly off. I will be reffering to the band switch (S2 in the scematic) wafers as A to M starting from the front. This is where
90% of the mod takes place.

(Note this mod assumes you have a copy of the operaters manual and scematic)

Due to Lawsuits I must make the usual disclaimer:
This mod is only garranteed to work on my radio.
I make no warranties about its usefullness on yours. If you break your radio
you own the pieces.

Locate wafer C (3rd from the front). Study it for a while and familiarize yourself as to which tab engages which bands. Isolate 10B by cutting the wires between it and the 10A tab and the 10C tab. Then using some hookup wire jumper the 10A and 10C tabs. Now due to the 15 meter tab being buried on this wafer I elected to run a wire from the 10B tab to the capicitor on the adjoing circuit board. Run a wire from the 10B tab to Capicitor TC14 (do this under the circuit board and make sure you connect to the non-ground side.)

Locate wafer E. Isolate 10B just like the wafer C. It is a major pain in the butt to do but it can be done. Connect 10B and the 15 meter tab. Now due to the fact that 10C and D are so deep I elected to run a wire from 11 meter tab to TC5 instead of trying to jumper them on this one.(Take the same precations here as above)

Locate wafer H. Jumper the 15 meter tab with the 10B tab (It has nothing attached, so this one is easy.

Locate wafer M (The final tank coil wafer). Isolate 10B as before. Jumper 10A
and 10C. Run a wire from 10B tab to the 15 meter tab(It's kinda deep but do-able).

Well that's all for this side for now. Turn the radio over. and locate the
Het crystals in the front right hand side. Remove the 10C and 10D crystals. Replace them with the 10A and 10B crystals respectively.
Put the 30.520 crystal in the 10A position and the 24.020 crystal in the 10B position. Turn the radio back over to realign the 10 and 15 meters bands.

Realign 10 and 15 meters per the users manual. Put the case back on.

That's it! Except for the loss of 29MHZ. I plan to build a switch using the
relay to switch the 28 and 29 mhz crystals. Should be easy as one leg is grounded so all you need to switch is 1 leg per crystal. As I stated before I plan to use the clarifer switch and replace it with a pot with a pull-on switch. With some nice rub on numbers you could make it look factory.
(BTW Does anybody know of a good source for these in white? All I can find around here are black)

I am in the proccess of making many more mods to this radio to bring it onto the 90's. I can't help it. I'm a tinkerer. I'd rather work on my rig than
use it (Grin). I will be posting them as I get them completed.
(If there is interest)

YES RIGHT YOU ARE G-Ray!!

Aye SWL the ham bands and it be real Circus of Indius complete with
critchety old 2-faced farts, cheap assed bastards who try to jew down on a
25 cent price item at a hamfest and many sexual perverts than
in the redlite district of town. Greatest collection of geek mental
patients in any place. I went to a few ham fests with CB friends from the
Raleigh-Durham NC area, never seen bigger collection of nut cases wearing
clothes looking like they have not been washed in ten Years. My faves were
the ham goofballs wearing old army and cammo type clothing with 4 or more
walkietalkies on their beer gut streech'd belts. They look and act like
they were ready to go to a McDonalds or a Lubys after the hamfest with an
assault weapon or back to work at Post Office the next day. Scary!
Be afraid as most hams seem to not be wrapped too tite in the head.

Anyway here are some frequencies where you can hear ham radio ops in their
natural enviornmental, using dirty language on a DAILY 24 HOUR
shift work. These nuts really must not need sleep, I hear them comedy all
time on my old R-1000 Kenwood which sits next to my Uniden 2510 and
Sommerkamp CB radio - Leon N.C. "Hoppy Leo"

6am all day long, till sundown --> 14.300 to 14.313 USB
After sundown or starting 8pm to midnite --> 3.894.5 & 3.901 & 3.950 LSB
Midnite to 6am --> 3.853 or sometimes 3.950 continued LSB

24 Hours a day -- 7 days a week all manner of nutcase and mentaly
derranged ham op's on the above freq's and also check 3.850 LSB
late nite when 3.853 is quiet not too often.

There are WEB PAGES put up by hams with more info on crazy
places on ham radio bands. Here are a few to go see sometime:

True, the graphite core will make it lossy. But if you remove the pencil, the resulting air core coil is likely to have a higher Q than one wound on a toroid. It is likely to be more temperature stable too. The Q would be better if the coil were larger than pencil diameter, however.

>>The other key advantage a toroid gives you is the fact that it's
>>self-shielding to a large extent. That can simplify circuit layout
>>quite a bit.

That's the much more important advantage of the toroid.

Could one make the air core coil into a air-core toroid? Would it still be at least somewhat self-shielding?

Go for it. They're easy, generally idiot-proof, and work well.
Bear in mind the limitations of present-day DDS (it's *not*
a panacea) and you will get very worthwhile results.

You will need a computer to tell the DDS chip what to do, but
that's easy these days - microcontrollers are cheap, easy to
use and hard to kill, and every ham shack I've seen lately has
a computer in it anyway...that XT you've been using as a door
stop is overkill for this task.

They are very easy to work with. I have a Qualcomm Q2334-50 running off the PC parallel port with a couple of glue chips and an outboard Harris DAC. The AD9850 from Analog Devices also seems to come highly recommended, and has the advantage of fewer pins to wire up and no requirement for a separate DAC.

DDS and PLL are two technologies that were almost made for each other. You can build a simple PLL with a DDS-based reference that gives you the best of both worlds.

Source record: 89008

For what it's worth, I checked an old HEP replacement guide, a couple of old Motorola data books, and a couple of hobby books that did include some IC audio amplifiers of what I figure is the proper vintage, and I can't find any reference to an MC1542.

Did you get the number right? Is there a date code on it to say when it was made? I have a mental picture of it being something from the early seventies, when a lot of external components were needed to get the IC audio amplfiers going. If I'm wrong about that, then I may be looking in the wrong place.

Is the problem the audio amplfier? If so, it might be simplest to treat the section as a module, and build a simple amplifier using the LM386 (if that provides the needed output power), and patch it into the circuit.

Direct Digital Synthesis.

– – –

DDS synthesizes a sine-wave signal in the digital domain by cycling the contents of a sine lookup table through a high-speed DAC at the desired frequency.

DDS chips are fun to play with, and are exceptionally powerful. Advantages include low cost, design simplicity, high frequency switching speed, range (typically DC to 50+ MHz output for modern parts), stability and freedom from phase noise (determined solely by the fixed-frequency clock driving the DDS chip's phase accumulator), and precision (typical 32-bit parts are tunable to within a fraction of a Hz over the entire HF spectrum.)

Drawbacks include quantization noise due to the finite # of bits available on the DAC, typically 10 or 12, and phase-truncation spurs due to the incongruence of the phase accumulator's word size versus the frequency being synthesized. The latter can be especially troublesome because they often occur too close to the desired carrier to be disposed of with a passive LC filter. Frequently the output of a DDS is cleaned up with a relatively-simple PLL before being used in a receiver LO or other noise-sensitive application. For casual homebrewing the PLL cleanup loop isn't strictly necessary (cf. the number of popular "Digi-VFO" articles appearing in magazines of late).

Another aspect of DDS which some consider an advantage and others a drawback, is that they're tough to apply without having a microprocessor around to control them.

The later ARRL Handbooks have some reasonable -- if not spectacularly comprehensive -- information on DDS in them. Qualcomm has some excellent app notes at www.qualcomm.com as well.

True, the graphite core will make it lossy. But if you remove the
pencil, the resulting air core coil is likely to have a higher Q than
one wound on a toroid. It is likely to be more temperature stable
too. The Q would be better if the coil were larger than pencil
diameter, however.

That's the much more important advantage of the toroid.

LOL. I liked that one too. :-)

But when will QSLs become electronic? A one-time key, Password protected and encrypted QSL verification! Then the QSL could be sent by any means required or available such as internet, packet, CW, or phone. A QSL bureau web site could handle the entire transaction, and the recipients could instantly verify and print if they like, or just leave it in memory at the bureau.

We would then exchange "QSL information" by simply sending a unique password serial number during the QSO.

Maybe someone's already cooked this scheme before. But it's worth heating up again.

Not sure I follow you there. It strikes me that an air-core inductor will almost *always* have a lower Q than an equivalent toroidal inductor, simply because you'd need several times as much wire to get the same inductance without the toroid core. More wire = more ESR for the same XL = lower Q. Not to mention greater vulnerability to interwinding capacitance losses with a multiturn air-wound inductor.

I'll confess I'm not too familiar with what other properties of the core, besides its permeability, affect the final Q value. Barring core saturation effects, a toroid should exhibit less loss in general than a reasonably-sized air-wound inductor of similar value, due to more effective flux coupling if nothing else. It's always been my understanding, reinforced by empirical experimentation, that it's hard to beat an appropriately-chosen toroid core when it comes to winding a high-Q inductor for practical HF work.

Sure, you might do better with a *much* larger air-wound coil wound with *much* heavier wire, but as a practical option for substitution in a circuit designed around a toroid, I'd have my doubts about that approach. I assume he's building a receiver front end, not a kilowatt matchbox. :-)

In a word, YES! The self-shlelding comes from the shape of the coil
more than anything, with external fields inducing a voltage in some part
of the winding and a voltage of the opposite sign in turns lying
opposite to "some part of the winding".

Nobody seems to be mentioning it, so here goes. At certain frequencies
the commercial toroids are practically giving you air core inductors in
toroidal form. They have no magnetic material and just define the shape
as toroidal (good for the pickup and other coupling properties.)

This range lies around 50 MHz to 150 MHz. Q=150 or more can be reached. You can get these high Q-values with good solenoids as well, in the upper frequencies. (I have measured around 400 on a commercial coil wound with flat silver-plated conductors.)
You can also do quite well at lower frequencies with patience to use some of the better winding structures (not just a multilayer solenoid.) with solenoids using no cores (no worry about saturation causing IMD, etc.)

Hello all!

30 Meters transmit for the FT-101EE

The first thing is of course to unplug the rig (G). I grin at this but
I've
been bitten a few times and this mod can bite if the rig is plugged in.
You will have to remove the entire case. IE the top, bottom and wrap case.
(I call the wrap case the case that is left after both the top and bottom
are
removed). With this rig this is pretty simple. After removing the case put
the
radio on it's back all modifications are on the bottom. (All refrences will
be
frm the rig on it's back and facing you) Then remove the cover from the
tuned
circuits. It will be the large cover on your left with a bunch of holes in
it
This will expose the tuned circuits. You will notice 3 circuit boards with
mucho trimmer capicitors and the bandswitch wafers. This is where all our
mods will be made.

From the factory the WWV position shares the 20 meter tuned circuits in
the receive end. We will be removing these jumpers and adding components
to giove 30 meters it's own tuned circuit in receive and transmit.

The first thing we need to do is get oriented. We will call the first circuit
board (nearest to you) PB-1 the next one PB-2 and the last one PB-3. Yeasu calls
then PB-1188, PB-1187A and PB-1092 respectivly. I like my names for
simplicity. Also I will be refering to the band switch wafers by letters
starting with the one nearest to you as A, the next one as B etc ending with
M. I guess this would be a good time to give you a parts list.
This is the parts list from the original article. Liberal substitutions from
your junk box is allowed, as a matter of fact my parts list just vaugely
resembles this. As long as you can get close on the capicitance you will be
OK.

T1 & 2 2 79pf Trimmers rated at 250V for PB-1 and 2
T3 1 40pf Trimmer rated at 500V for PB-3
C1 1 50pf Silver Mica cap for PB-1 rated at 250V
C2 1 68pf Silver Mica cap for PB-2 rated at 250V
C3 1 68pf Silver Mica cap for PB-3 rated at 500V

Let's get to work. The first thing is to remove the jumpers connecting the
WWV setting with 20 meters. You will need to remove the jumper on wafers C and
E.
C is no problem but E is kinda tight. I would recomend removing E at the 20
meter tab and extending the wire to our new capicitors we will be
installing.

Now we need to install our new capicitors for 10mhz. On PCB-1 the only place
I could find to put T1 and C1 was between the upper right hand cap and the
mounting screw. Install the caps in parallel with one leg at ground and the
other leg going to switch wafer C at the WWV position. Install TC2 and C2
on PB-2 as close to the left edge of the PB as possible the same way
except bring the other leg to the wire you have hanging off wafer E.
Install TC3 and C3 on PB-3 on the side closest to you between the 2 mounting
points for the cover for the tuned circuits in the same way. You will have
to run a wire from them to wafer switch G. It is kinda hard to get to and
deep but it is doable (If I can do it anybody can, I promise).

Now the fun part begins (G). For some reason Yeasu left out the tab on
Wafer l and we will need one here. I scrounged my junk box for a tab
that resembled the one they had used and found one that was close.
You will have to do the same. Cut the new tab very carefully from the old
switch with wire cutters and cut away the brad on one side. Then
Super glue the new tab in the proper position on wafer switch I. After
the glue has set attach a jumper from the tab to the 40 meter tab
(the next one to the right with the cloth cover). All we need to do

now is put a tap on the final tank circuit for our new band. Go to
wafer M. We will be putting a wire from the 30 meter position tab
to the pi tank coil. Remove the 2 inductors that are in the way and
attach a wire in-between the 20 meter and 40 meter taps. (This should
be just below the nut holding the bandswitch together). Run
this wire to the tab on wafer M. Reattach the 2 inductors.
Now drill holes in the cover in order to reach the trimmers and put
the cover back on.

Now for the aligment. The new band will have to be aligned.
Put the preselector at 4 on the dial (Not 4 O'Clock). Go to 10.000 mhz
and load it up into a dummy-load as well as you can (Remember to keep
your plate current below 200 ma).Don't be fooled by the noise at 10 on
the dial. It is a spur generated by the rig and if you load up on it it
could damage the rig. Adjust TC2 and TC3 for the highest power output.
Then turn on the calibrater and tune for a S-meter reading under 10 and
adjust TC1 for the best S-meter reading.

Now you can put the cover back on. You should have as good performance
on 30 meters as you have on any othe band.

I make no warrantys for this modification. If you mess your radio up it
is not my fault. I have done this mod and It works great on my radio.
I cannot say the same about yours. You do this at your own risk.

Next week I add 12 and 17 meters

Hello All!
Putting the FT-101EE on 17 and 12 meters

Ok folks here is the last installment of my series on adding the WARC
bands
to the Yeasu FT-101EE. The only parts you will need for this are as
follows.

1 Crystal cut for 30.520 Mhz (for 12 meters)
1 Crystal cut for 24.020 Mhz (for 17 meters)
I ordered both from International Crystal out of Oklahoma City. but there
are many sources for these.

1 DPDT 12v relays from Radio Shak
About a foot of hookup wire (22 gauge multi conductor).
A small experimenters circuit board form Radio Shack.
A good pair of wire cutters and a lot of patience. (workng room is a premium
on this mod)

Before cutting any wires I did some experimenting and found that the rig would tune up on 12 meters from the 10 meter position and tune up on 17 meters from the 15 meter position.

So how do we go about inserting 12 and 17 meters without sacrificing anything. I decide to move 28-28.8 mhz to the 10C position and use it's slot for 12 meters. Then move 28.5-29 mhz to the 10D position and use it's spot for 17 meters. Then build a switch (using the relay) to switch the 28 and 28.5 mhz crystals with the 29 and 29.5 crystals using the clarifer
switch (I like the idea of the LED and it reminds me of my old Kenwood 830).
Then replace the clarifier pot with a combination pot and pull on switch and
maybe a new LED for it. I have not completed the switch part of the mod but you
get the Idea. It will work. It is kinda involved, but this is the only way I could figure out how to do it. I'm sure someone else has done it differently.
(I thought of many different ways myself) but this is the way it worked for me.

First as in my last article have the radio on it's back and facing you with the case comepletly off. I will be reffering to the band switch (S2 in the scematic) wafers as A to M starting from the front. This is where
90% of the mod takes place.

(Note this mod assumes you have a copy of the operaters manual and scematic)

Due to Lawsuits I must make the usual disclaimer:
This mod is only garranteed to work on my radio.
I make no warranties about its usefullness on yours. If you break your radio
you own the pieces.

Locate wafer C (3rd from the front). Study it for a while and familiarize yourself as to which tab engages which bands. Isolate 10B by cutting the wires between it and the 10A tab and the 10C tab. Then using some hookup wire jumper the 10A and 10C tabs. Now due to the 15 meter tab being buried on this wafer I elected to run a wire from the 10B tab to the capicitor on the adjoing circuit board. Run a wire from the 10B tab to Capicitor TC14 (do this under the circuit board and make sure you connect to the non-ground side.)

Locate wafer E. Isolate 10B just like the wafer C. It is a major pain in the butt to do but it can be done. Connect 10B and the 15 meter tab. Now due to the fact that 10C and D are so deep I elected to run a wire from 11 meter tab to TC5 instead of trying to jumper them on this one.(Take the same precations here as above)

Locate wafer H. Jumper the 15 meter tab with the 10B tab (It has nothing attached, so this one is easy.

Locate wafer M (The final tank coil wafer). Isolate 10B as before. Jumper 10A
and 10C. Run a wire from 10B tab to the 15 meter tab(It's kinda deep but do-able).

Well that's all for this side for now. Turn the radio over. and locate the
Het crystals in the front right hand side. Remove the 10C and 10D crystals. Replace them with the 10A and 10B crystals respectively.
Put the 30.520 crystal in the 10A position and the 24.020 crystal in the 10B position. Turn the radio back over to realign the 10 and 15 meters bands.

Realign 10 and 15 meters per the users manual. Put the case back on.

That's it! Except for the loss of 29MHZ. I plan to build a switch using the
relay to switch the 28 and 29 mhz crystals. Should be easy as one leg is grounded so all you need to switch is 1 leg per crystal. As I stated before I plan to use the clarifer switch and replace it with a pot with a pull-on switch. With some nice rub on numbers you could make it look factory.
(BTW Does anybody know of a good source for these in white? All I can find around here are black)

I am in the proccess of making many more mods to this radio to bring it onto the 90's. I can't help it. I'm a tinkerer. I'd rather work on my rig than
use it (Grin). I will be posting them as I get them completed.
(If there is interest)

# 4638. Re: Hi-level tube mixers

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-20 00:00:00 UTC
From: n2ey@aol.com
Message-ID: <19971120024401.VAA07627@ladder01.news.aol.com>
Source record: 88924

Here's some more info:

The July, 1994 issue of Electric Radio had a good article on the Squires Sanders SS-1R receiver. This unit used two 7360 mixers and no rf amplifier, and achieved both good sensitivity (better than .25 uV for 10 db S+N/N on ten meters, SSB bandwidth) and good strong signal/dynamic performance (it takes over a volt to overload). Unfortunately there was no reference to its performance by "modern" measurements.

The real measure, though, is how well the rx performs in the kind of operating you like to do. Specs only tell so much - a design may test well, but under real life band conditions have so much LO noise that you can't hear the weak ones, etc. Also important is how "buildable" a design is.

Hope this helps. Keep those bottles burning!

# 4641. 2N2222 Colpitts

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-20 00:00:00 UTC
From: Dennis Erwin Thurlow <geosynq@trader.com>
Message-ID: <34742135.6F88@trader.com>
Source record: 88927

Someone posted a link to SPICE colpitts files and a SPICE demo,
in response to my question about making a Colpitts Oscillator with a 2N2222.
Thanks a million. I've spent the last two days learning to use it, but I'm
getting results somewhat like my 30MHz scope gives with the actual circuit.
I'd written the scope results off as grounding problems, but now...?
Could I trouble you for a tad more help?

The 1996 ARRL Handbook shows a 2N2222 Colpitts in Fig. 14-13b,
which I have posted as a CIR at http://www.trader.com/users/5012/9019/radio.htm
I'm trying to make a fixed 29MHz oscillator so I've modified this schematic
from the published one in 3 ways:
The parallel tuning caps in the tank have been replaced with a single 33 pf cap,
L1 has been given a value of .91uH,
and I have assumed the RFC is 135uH from elsewhere in the text.
I'm looking at current and voltage at nodes 1 and 4, and don't understand
why the values are volts (!) when stepped at 5ns but only pico- or femto- volts
when stepped at .2us? In fact, different stepping rates give different resonant
frequencies, similar to what I'm seeing at different sweep rates on the scope.

>
> This is an attempting to design a low-power video transmitter for UHF Channel
> 83.

Channels 70-83 were dropped in 1984 to make way for the "new"
Mobile Radio services (ie: Cell Phones).

You will make a LOT of people VERY angry!!!!

Legally, you should use 910MHz (I forget the actual band limits).

If you MUST use a UHF channel, use UHF channel 28 or higher (Ch's
14-22 are shared with mobile radio services ie: Police, Fire,
Taxi, etc). Ch 28+ is far enough away to prevent any "splatter"
from messing up any of those services.

Your oscillator does not have to be that stable. Most TV's AFC
circuits can track +/- 500KHz.

Do an Alta Vista search for "ATV transmitter", and you will come
across transmitter circuits designed for Amateur TV (450MHz &
910MHz).

Cheers,
Paul Grohe

=========
When in a glass jar the dummy load will radiate a lot of RF ! That's
why it's important to fit it in a metal container .....paint cans or
similar . If necessary these can be solder-attached to each other
with the appropriate top/bottom removed ,to accommodate the length of
the available resistor(s)

Dear radio hobby club volunteer:

FBOM Magazine Online, the interactive version of FBOM Magazine, is offering to post information about your non-profit radio club's hamfests, jamborees and other large radio hobby-related events free of charge on our web site <http://n-lemma.com/FBOM/>.

The only strings attatched are that your club is a non-profit organization and you can use some extra publicity.

These listings will be continously updated. As an added incentive for others to rely on the listings, we will contact you 2 weeks prior to your event and put a "Confirmed or not confirmed by FBOM" stamp on the listing.

Please send us information about your club's fundraising events as soon as possible. You can also use a form on the our web site. Simply click any references to "Hamfest listings."

For any questions, email the Publisher, Eric Bond, N9VJG <n9vjg@n-lemma.com> or the Webitor, Chuck Brown, N9UPO <n9upo@n-lemma.com>.

Feel free to spread the word to other radio hobby-related clubs and organizations--especially those who do not have internet access. Our mailing address:

FBOM
P.O. Box 7711
Westchester, IL 60154-7711

Thank you and 73s

That was me. Two days is very little time to learn SPICE -
congratulations on an excellent first try!

In the schematic, turn off "Node Numbers", "Pin Connections",
and "Grid". These just get in the way.

The inductor value of .91u is hard to read. You cannot see the
decimal point, and it looks like the value is 1,000 times
larger. Express components as a number larger than 1.

Just a minor point, but I prefer ground symbols to point to
ground. I re-arranged the schematic to orient the symbols a bit
better.

In Transient Analysis:

1. You need to carefully set each parameter to correspond with
the desired analysis. Do not accept the defaults given.

2. The "Time Range" of 100 us is far too great. This gives a
similar problem to sampling scopes when the frequency is above
the sampling rate, and causes the waveform to alias.

You need to figure out how many cycles you wish to view and set
the "Time Range" to suit, just like a scope! For a 29 MHz
signal, the period is 34 ns. I set the "Time Range" to 500ns.

After the circuit is working, you can change the range to look at the signals further downstream after the amplitudes have stabilized.

3. The "Maximum Time Step" should be set to some other value than just zero. SPICE will sometimes go unstable if the time step is too large. For this time scale, start with 5e-10, or about three orders of magnitude smaller than the "Time Range".

4. The "Number of Points" needs to be larger than 51. I set it to 400.

5. Turn off "Auto Scale Ranges". This tells SPICE to re-scale the Y values to get a waveform on-screen. You may get waveforms, but they may be greatly magnified and are meaningless.

Most of the time, you want to set the Y scale to some reasonable value and tell SPICE to leave it there. This will tell you if the circuit is performing the way you expect, or if it has died.

6. In the "Y Expression" entries, it is a bad idea to refer to node numbers. These change if you add parts or move them around. It is better to use Text mode and place a signal name above the desired trace on the schematic, and refer to the signal name in "Transient Analysis Limits".

7. The "X Range" corresponds to the 100 us "Time Range" described above, and is far too great. I changed it to 500n to correspond with the "Time Range" setting.

8. The "Y Range" shows the effect of letting SPICE autoscale.

With values such as

"1.1718e-005,1.1708e-005"
"3.10134,3.10133"
"2.4317,2.43169"

you can easily see the amplitudes are in the microvolt region and the circuit is not oscillating. The waveform amplitudes should be several volts, not microvolts.

You need to set the "Y Range" to values you expect to see, and let SPICE confirm what you already know.

9. You cannot assign two different Y scales to the same waveform. In order to measure the base current, put it on a different graph.

10. Trying to measure a waveform at node 4 is futile. This node is between a large choke and the emitter resistor. If the choke is doing its job, there will be very little signal to measure.

10. The "Fmt" tells SPICE how to format the output data. I usually set it to "5.3".

Back to the schematic.

An LC oscillator takes a long time in SPICE to start oscillating. I added a small 0.1V "STRT" pulse to the tank at the bottom of the 1000pf series caps. This has no effect after the initial step, so it does not affect the analysis.

After making all these changes, the transient analysis showed no oscillations. The dc voltages were normal, so I expect the loop gain around the oscillator was too low.

The ratio between the 1000 pf series caps and the 33 pf tuning cap seemed too large. I changed the 1000pf series caps to 200pf just to try to get the oscillator loop gain high enough to oscillate.

That did the trick - the circuit oscillated for the first time!

The rest is up to you. I am attaching the CIR file as a small zip.

On Fri, 14 Nov 1997 08:22:51 +0000 Ian White, G3SEK
(G3SEK@ifwtech.demon.co.uk) wrote in rec.radio.amateur.homebrew:

: A good index needs a lot of creative human input to identify which key-
: words readers will want to look for. The key-words often don't exist in
: the main text at all (eg condensers - see capacitors) so only the
: indexer can think to include them. Only a real, human indexer can find
: the optimum balance between length and detail.

When I was a kid in the 50's my father gave me an old 1942 Special Defense Edition ARRL Handbook. From the early 60's I have bought a current ARRL Handbook every five years or so. From as far back as I can remember I have found the indexes in ARRL Handbooks very hard to use -- there is always a mismatch between what I want to look for (I *know* it is there!) and what they index. My old Handbooks always have notations in the index where I have noted the things couldn't find.

I know making an index is hard, I recently co-authored a book and was very happy to have an expert do the indexing. Even so, my own book's index is full of notes for things I have looked for and failed to find, which I hope will be indexed in the next edition.

Many years ago, in John Barth's novel _The End of the Road_ I read the comment of a character who was a professional indexer. He at some point remarks (I paraphrase, I can't recall the exact words) that anyone who tries to index his own book is a fool. I have often thought of that when looking for something in the ARRL Handbook.

# 4649. Re: Difference between torroid or air wound?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-20 00:00:00 UTC
From: Michael Black <blackm00@CAM.ORG>
Message-ID: <Pine.GSO.3.94.971118223355.27326A-100000@Ocean.CAM.ORG>
Source record: 88935

Toroid wound coils are self-shielding. So reasons of layout may be a good reason for using them rather than non-toroid wound coils. If you're building from scratch, it may not matter, since you can change the layout to keep components away from the coil, or to add shielding. And you can fiddle with the actual coil to get the correct inductance that might be affected by the nearness of components.

One important thing to note is that it's the donut shape of the toroids, not the material (ferrite or iron), that they are made of that make them shielded. Doug DeMaw had a bit about this in the Hints & Kinks column years ago, precisely because this point may be missed by many.

I've kept an eye out for something that would provide the donut shape for making coils at VHF, because the self-shielding is a useful thing.

One reason for using ferrite or iron cores over air wound is that the core material allows for fewer turns for the same inductance, an advantage at times.

A disadvantage of toroid wound coils is that there is no way of adjusting them. You either have to play with the number of turns, something made difficult by there not being any partial turns in a toroid wound coil. Or with external capacitors, changing fixed capacitors until you hit the right value, or a trimmeer. Added fuss or added expense, when you can often adjust an air wound coil be expanding or compressing turns.

There once was an article in QST about a receiver, and the author had made partially adjustable toroids by combining a slug-tuned coil with a toroid.

I don't have the article handy, but the idea was reproduced in Pat Hawker's Amateur Radio Techniques.

The author glued a small slug tuned coil form to the side of the toroid with epoxy. He wound 2/3 of the turns over the toroid, and the remaining 1/3 turns over the over the coil form and the toroid. I doubt I'm describing this well. Apparently, a 10 percent variation is possible, and if I recall, he said it was still partially self-sheilding.

One important thing to remember is that not all toroids are used for tuned circuits. If they are used for broadband transformers, they count on the core material for the broadband characteristic, so they can't be replaced with air-wound coils.

# 4650. Re: 6 METER SSB RIG / KIT

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-20 00:00:00 UTC
From: Michael Black <blackm00@CAM.ORG>
Message-ID: <Pine.GSO.3.94.971116200044.5214A-100000@Ocean.CAM.ORG>
Source record: 88936

But if you're going to use a double balanced on the signal frequency,
you might want to think about using a high level modulator feeding
the antenna. You'd see these years ago, when SSB was still relatively
new and DSBsc was sometimes promoted as an almost as good thing. I
recall at least one article where a commercial AM ham rig was converted
to DSBsc by reworking the PA.

The advantage is that you don't have to worry about a chain of
linear amplifiers to get the output of a low level modulator up
to a suitable level.

DSB rigs would be a good way of getting activity on 6 meters. They
aren't a lot more complicated than an HF QRP rig, and 6 meters
is still low enough that layout is still not too much of a problem.
Their simplicity would allow for portable operation, due to
compactness and lower current drain, which would allow for mountaintopping
where the low power and simple antennas would work okay.

Of course, if enough people started building DSB rigs for 6 Meters,
the chance increases that they might start trying to contact each other.
And DSBsc doesn't work so well with a direct conversion receiver.

Interesting, code needed to make a phone call.

## 4654. Obtaining current governement electronic manuals

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-20 00:00:00 UTC
From: au156@yfn.ysu.edu
Message-ID: <652199$t88$1@news.ysu.edu>

Is there any fairly easy way to purchase technical
manuals of current US military electronic equipment?

I'd actually just like to obtain the schematic of a simple
non classified device that is used by the US Navy and maybe
other branches, as well as by ocean research institutions,
both government and private.

It's equipment I worked on (in development) some years ago,
so I'm pretty familiar with it, and one of the contractors who
once (and maybe still) produced it is nearby.

Hank Riley, N1LTV

Great article! If I ever end up with enough free time to play with
FPGAs, that's the first place I'll look to get started.

These days, whenever I need more than a half-dozen or so TTL chips in a
homebrew project, I'm usually tempted to say "screw it" and go run the
project off a cheap PC motherboard. That's the plan for my current
receiver project at any rate. I might well rethink that strategy in
favor of an FPGA-based controller, if it turns out to be feasible to do
so. It would sure be nice to save the space taken up by the PC
motherboard and power supply.

Any "cored" inductor will have core losses. For a small inductance, the
extra wire loss probably won't offset the reduction in core losses. If you're
talking about a choke of several millihenries, I'd agree that the extra wire
losses would likely dominate.

A couple of years ago I posted on the old fido echo ham radio and had lost
it. I have had many requests for it
Thanks to N8BLK finding the last 2 posts in his archives here it is.

Marty, I only found part 2 & 3, when I checked, however hope this helps or
brings back some memories, I'm copying it into this message.

Hello all!

30 Meters transmit for the FT-101EE

The first thing is of course to unplug the rig (G). I grin at this but
I've
been bitten a few times and this mod can bite if the rig is plugged in.
You will have to remove the entire case. IE the top, bottom and wrap case.
(I call the wrap case the case that is left after both the top and bottom
are
removed). With this rig this is pretty simple. After removing the case put
the
radio on it's back all modifications are on the bottom. (All refrences will
be
frm the rig on it's back and facing you) Then remove the cover from the
tuned
circuits. It will be the large cover on your left with a bunch of holes in
it
This will expose the tuned circuits. You will notice 3 circuit boards with
mucho trimmer capicitors and the bandswitch wafers. This is where all our
mods will be made.

From the factory the WWV position shares the 20 meter tuned circuits in
the receive end. We will be removing these jumpers and adding components
to giove 30 meters it's own tuned circuit in receive and transmit.

The first thing we need to do is get oriented. We will call the first circuit
board (nearest to you) PB-1 the next one PB-2 and the last one PB-3. Yeasu calls
then PB-1188, PB-1187A and PB-1092 respectivly. I like my names for
simplicity. Also I will be refering to the band switch wafers by letters
starting with the one nearest to you as A, the next one as B etc ending with
M. I guess this would be a good time to give you a parts list.
This is the parts list from the original article. Liberal substitutions from
your junk box is allowed, as a matter of fact my parts list just vaugely
resembles this. As long as you can get close on the capicitance you will be
OK.

T1 & 2 2 79pf Trimmers rated at 250V for PB-1 and 2
T3 1 40pf Trimmer rated at 500V for PB-3
C1 1 50pf Silver Mica cap for PB-1 rated at 250V
C2 1 68pf Silver Mica cap for PB-2 rated at 250V
C3 1 68pf Silver Mica cap for PB-3 rated at 500V

Let's get to work. The first thing is to remove the jumpers connecting the
WWV setting with 20 meters. You will need to remove the jumper on wafers C and
E.
C is no problem but E is kinda tight. I would recomend removing E at the 20
meter tab and extending the wire to our new capicitors we will be
installing.

Now we need to install our new capicitors for 10mhz. On PCB-1 the only place
I could find to put T1 and C1 was between the upper right hand cap and the
mounting screw. Install the caps in parallel with one leg at ground and the
other leg going to switch wafer C at the WWV position. Install TC2 and C2
on PB-2 as close to the left edge of the PB as possible the same way
except bring the other leg to the wire you have hanging off wafer E.
Install TC3 and C3 on PB-3 on the side closest to you between the 2 mounting
points for the cover for the tuned circuits in the same way. You will have
to run a wire from them to wafer switch G. It is kinda hard to get to and
deep but it is doable (If I can do it anybody can, I promise).

Now the fun part begins (G). For some reason Yeasu left out the tab on
Wafer l and we will need one here. I scrounged my junk box for a tab
that resembled the one they had used and found one that was close.
You will have to do the same. Cut the new tab very carefully from the old
switch with wire cutters and cut away the brad on one side. Then
Super glue the new tab in the proper position on wafer switch I. After
the glue has set attach a jumper from the tab to the 40 meter tab
(the next one to the right with the cloth cover). All we need to do

now is put a tap on the final tank circuit for our new band. Go to
wafer M. We will be putting a wire from the 30 meter position tab
to the pi tank coil. Remove the 2 inductors that are in the way and
attach a wire in-between the 20 meter and 40 meter taps. (This should
be just below the nut holding the bandswitch together). Run
this wire to the tab on wafer M. Reattach the 2 inductors.
Now drill holes in the cover in order to reach the trimmers and put
the cover back on.

Now for the aligment. The new band will have to be aligned.
Put the preselector at 4 on the dial (Not 4 O'Clock). Go to 10.000 mhz
and load it up into a dummy-load as well as you can (Remember to keep
your plate current below 200 ma).Don't be fooled by the noise at 10 on
the dial. It is a spur generated by the rig and if you load up on it it
could damage the rig. Adjust TC2 and TC3 for the highest power output.
Then turn on the calibrater and tune for a S-meter reading under 10 and
adjust TC1 for the best S-meter reading.

Now you can put the cover back on. You should have as good performance
on 30 meters as you have on any othe band.

I make no warrantys for this modification. If you mess your radio up it
is not my fault. I have done this mod and It works great on my radio.
I cannot say the same about yours. You do this at your own risk.

Next week I add 12 and 17 meters

Hello All!
Putting the FT-101EE on 17 and 12 meters

Ok folks here is the last installment of my series on adding the WARC
bands
to the Yeasu FT-101EE. The only parts you will need for this are as
follows.

1 Crystal cut for 30.520 Mhz (for 12 meters)
1 Crystal cut for 24.020 Mhz (for 17 meters)
I ordered both from International Crystal out of Oklahoma City. but there
are many sources for these.

1 DPDT 12v relays from Radio Shak
About a foot of hookup wire (22 gauge multi conductor).
A small experimenters circuit board form Radio Shack.
A good pair of wire cutters and a lot of patience. (workng room is a premium
on this mod)

Before cutting any wires I did some experimenting and found that the rig would tune up on 12 meters from the 10 meter position and tune up on 17 meters from the 15 meter position.

So how do we go about inserting 12 and 17 meters without sacrificing anything. I decide to move 28-28.8 mhz to the 10C position and use it's slot for 12 meters. Then move 28.5-29 mhz to the 10D position and use it's spot for 17 meters. Then build a switch (using the relay) to switch the 28 and 28.5 mhz crystals with the 29 and 29.5 crystals using the clarifer
switch (I like the idea of the LED and it reminds me of my old Kenwood 830).
Then replace the clarifier pot with a combination pot and pull on switch and
maybe a new LED for it. I have not completed the switch part of the mod but you
get the Idea. It will work. It is kinda involved, but this is the only way I could figure out how to do it. I'm sure someone else has done it differently.
(I thought of many different ways myself) but this is the way it worked for me.

First as in my last article have the radio on it's back and facing you with the case comepletly off. I will be reffering to the band switch (S2 in the scematic) wafers as A to M starting from the front. This is where
90% of the mod takes place.

(Note this mod assumes you have a copy of the operaters manual and scematic)

Due to Lawsuits I must make the usual disclaimer:
This mod is only garranteed to work on my radio.
I make no warranties about its usefullness on yours. If you break your radio
you own the pieces.

Locate wafer C (3rd from the front). Study it for a while and familiarize yourself as to which tab engages which bands. Isolate 10B by cutting the wires between it and the 10A tab and the 10C tab. Then using some hookup wire jumper the 10A and 10C tabs. Now due to the 15 meter tab being buried on this wafer I elected to run a wire from the 10B tab to the capicitor on the adjoing circuit board. Run a wire from the 10B tab to Capicitor TC14 (do this under the circuit board and make sure you connect to the non-ground side.)

Locate wafer E. Isolate 10B just like the wafer C. It is a major pain in the butt to do but it can be done. Connect 10B and the 15 meter tab. Now due to the fact that 10C and D are so deep I elected to run a wire from 11 meter tab to TC5 instead of trying to jumper them on this one.(Take the same precations here as above)

Locate wafer H. Jumper the 15 meter tab with the 10B tab (It has nothing attached, so this one is easy.

Locate wafer M (The final tank coil wafer). Isolate 10B as before. Jumper 10A
and 10C. Run a wire from 10B tab to the 15 meter tab(It's kinda deep but do-able).

Well that's all for this side for now. Turn the radio over. and locate the
Het crystals in the front right hand side. Remove the 10C and 10D crystals. Replace them with the 10A and 10B crystals respectively.
Put the 30.520 crystal in the 10A position and the 24.020 crystal in the 10B position. Turn the radio back over to realign the 10 and 15 meters bands.

Realign 10 and 15 meters per the users manual. Put the case back on.

That's it! Except for the loss of 29MHZ. I plan to build a switch using the
relay to switch the 28 and 29 mhz crystals. Should be easy as one leg is grounded so all you need to switch is 1 leg per crystal. As I stated before I plan to use the clarifer switch and replace it with a pot with a pull-on switch. With some nice rub on numbers you could make it look factory.
(BTW Does anybody know of a good source for these in white? All I can find around here are black)

I am in the proccess of making many more mods to this radio to bring it onto the 90's. I can't help it. I'm a tinkerer. I'd rather work on my rig than
use it (Grin). I will be posting them as I get them completed.
(If there is interest)

Your future partner in China, and I'm sure you can
get more benefit from us!

Vanlong Technical Co., Ltd. is a worldwide supplier
of quartz crystal products. We mainly introduce the
quartz crystal and other electronic products made in
the major home coordinated manufacturers to overseas.

We are able to provide you strictly inspected quality
products in reasonable prices.

If you are interested in China quartz crystal products,
please feel free to visit our website:

Hi Josh, Michael and the group. Hi once again Josh! Nice to see you in print here. When I saw your request a few days ago I tried to find any info on the MC 1542. None to be had. With the replies that you just now got, I would suggest you look carefully to determine if there might be a better number or a logo on that part. If it is Motorola, then you might find a set of "bat wings" thereon. Cliff Buttschardt K7RR (ex W6HDO)

I am truly impressed by the wealth of response you got to this one. Even though some of the responders went off on tangents, even the tangents were interesting.

I'm going to throw in my own 2 cents worth anyway, as some of the responses seemed too indirect.

You ask: "...does it matter...?"

Probably not. Especially if you're talking about 2-mix or 6-mix toroids. They're really only good at HF.

As some of the posters pointed out, however, you may need a form (considerably) larger than a pencil.

There is already a "code requirement" for the internet.
Every user has to learn how to type. This weeds out those with no
hand-eye coordination or touch-insensitive persons...
The skill of touch-typing is very similar to the Morse skill.

In fact, my maximum CW speed and typing speed at one time were almost
exactly the same (topping out at about 45WPM). I had a "mental block" at
that speed for some reason. Through practice I increased my typing speed
to about 60WPM. Internet chat groups on the low end of the #channels
(where all the DXers work) was the fix.

Hi!,I do have for sale a lot of receiving tubes,for a fair price.
For any of your need,just contact me with the numbers you need
and I will do the best to help you out.....thanks

Eric By email or PH/FAX (250)868-1182

For Sale:
I have a large inventory of quality NOS tubes and a wide variety of radio related publications. Also available are radios, test equipment and misc. radio parts. My schematic service is the best price around at just $3 delivered for schematics and tuning info. Quality, tested used tubes are also available. If I don't have it, I'll try to help you find it! Hundreds of happy customers have used my service. Ask Rog42@aol.com for an e-mail copy of my latest offerings - list #1115-T

From: Dennis Erwin Thurlow <geosynq@trader.com>
Subject: 2N2222 Colpitts
Someone posted a link to SPICE colpitts files and a SPICE demo,
in response to my question about making a Colpitts Oscillator with a
2N2222.
Thanks a million. I've spent the last two days learning to use it, but I'm
getting results somewhat like my 30MHz scope gives with the actual circuit.
I'd written the scope results off as grounding problems, but now...?
Could I trouble you for a tad more help?
The 1996 ARRL Handbook shows a 2N2222 Colpitts in Fig. 14-13b,
which I have posted as a CIR at
http://www.trader.com/users/5012/9019/radio.htm
I'm trying to make a fixed 29MHz oscillator so I've modified this schematic
from the published one in 3 ways:
The parallel tuning caps in the tank have been replaced with a single 33
pf cap,
L1 has been given a value of .91uH,
and I have assumed the RFC is 135uH from elsewhere in the text.
I'm looking at current and voltage at nodes 1 and 4, and don't understand
why the values are volts (!) when stepped at 5ns but only pico- or femto-
volts

when stepped at .2us? In fact, different stepping rates give different
resonant
frequencies, similar to what I'm seeing at different sweep rates on the
scope.

There's no channel 83. That's part of the cell-phone allocation
now, and they would have no sense of humor after tracking down an
interference complaint. Even if they didn't notice, it's in the base
station side of things, so you'd be dealing, in any urban area, with a
ton of interference to your signal. (Beyond the fact that it's against
FCC regulations to have low power transmitters in the TV broadcast bands.
The legal stuff runs in 902-928 MHz).

Go for it. They're easy, generally idiot-proof, and work well.
Bear in mind the limitations of present-day DDS (it's *not*

a panacea) and you will get very worthwhile results.
You will need a computer to tell the DDS chip what to do, but
that's easy these days - microcontrollers are cheap, easy to
use and hard to kill, and every ham shack I've seen lately has
a computer in it anyway...that XT you've been using as a door
stop is overkill for this task.

Direct Digital Synthesis.

_ _ _
DDS synthesizes a sine-wave signal in the digital domain by cycling the
contents of a sine lookup table through a high-speed DAC at the desired
frequency.
DDS chips are fun to play with, and are exceptionally powerful.
Advantages include low cost, design simplicity, high frequency switching
speed, range (typically DC to 50+ MHz output for modern parts),
stability and freedom from phase noise (determined solely by the
fixed-frequency clock driving the DDS chip's phase accumulator), and
precision (typical 32-bit parts are tunable to within a fraction of a Hz
over the entire HF spectrum.)
Drawbacks include quantization noise due to the finite # of bits
available on the DAC, typically 10 or 12, and phase-truncation spurs due
to the incongruence of the phase accumulator's word size versus the
frequency being synthesized. The latter can be especially troublesome
because they often occur too close to the desired carrier to be disposed
of with a passive LC filter. Frequently the output of a DDS is cleaned
up with a relatively-simple PLL before being used in a receiver LO or
other noise-sensitive application. For casual homebrewing the PLL
cleanup loop isn't strictly necessary (cf. the number of popular
"Digi-VFO" articles appearing in magazines of late).
Another aspect of DDS which some consider an advantage and others a
drawback, is that they're tough to apply without having a microprocessor
around to control them.
The later ARRL Handbooks have some reasonable -- if not spectacularly
comprehensive -- information on DDS in them. Qualcomm has some
excellent app notes at www.qualcomm.com as well.

They are very easy to work with. I have a Qualcomm Q2334-50 running off
the PC parallel port with a couple of glue chips and an outboard Harris
DAC. The AD9850 from Analog Devices also seems to come highly
recommended, and has the advantage of fewer pins to wire up and no
requirement for a separate DAC.
DDS and PLL are two technologies that were almost made for each other.
You can build a simple PLL with a DDS-based reference that gives you the
best of both worlds.

True, the graphite core will make it lossy. But if you remove the
pencil, the resulting air core coil is likely to have a higher Q than

one wound on a toroid. It is likely to be more temperature stable
too. The Q would be better if the coil were larger than pencil
diameter, however.

That's the much more important advantage of the toroid.

Not sure I follow you there. It strikes me that an air-core inductor
will almost *always* have a lower Q than an equivalent toroidal
inductor, simply because you'd need several times as much wire to get
the same inductance without the toroid core. More wire = more ESR for
the same XL = lower Q. Not to mention greater vulnerability to
interwinding capacitance losses with a multiturn air-wound inductor.
I'll confess I'm not too familiar with what other properties of the
core, besides its permeability, affect the final Q value. Barring core
saturation effects, a toroid should exhibit less loss in general than a
reasonably-sized air-wound inductor of similar value, due to more
effective flux coupling if nothing else. It's always been my
understanding, reinforced by empirical experimentation, that it's hard
to beat an appropriately-chosen toroid core when it comes to winding a
high-Q inductor for practical HF work.
Sure, you might do better with a *much* larger air-wound coil wound with
*much* heavier wire, but as a practical option for substitution in a
circuit designed around a toroid, I'd have my doubts about that
approach. I assume he's building a receiver front end, not a kilowatt
matchbox. :-)

Nobody seems to be mentioning it, so here goes. At certain frequencies
the commercial toroids are practically giving you air core inductors in
toroidal form. They have no magnetic material and just define the shape
as toroidal (good for the pickup and other coupling properties.)
This range lies around 50 MHz to 150 MHz. Q=150 or more can be
reached. You can get these high Q-values with good solenoids as well,
in the upper frequencies. (I have measured around 400 on a commercial
coil wound with flat silver-plated conductors.)
You can also do quite well at lower frequencies with patience to

use some of the better winding structures (not just a multilayer
solenoid.) with solenoids using no cores (no worry about saturation
causing IMD, etc.)

That's the much more important advantage of the toroid.
Could one make the air core coil into a air-core toroid? Would it still be
at least somewhat self-shielding?

Subject: Matching Sweep Tubes
: Does anyone have any experience at matching sweep tubes. Can you describe
the
: procedure that you have successfully used?
I am familiar with the procedure used at RL Drake to match their finals
in the '60s.
They put the tubes in a fixture that had some fixed bias on the grid
and probably proper voltage on screen and plates, and measured the
plate current. The tester marked the current reading on the
tube envelope. Typical numbers were 25 to 45. At 600 volts (if that
is what plate voltage was) of plate voltage 25 probably meant 25 ma.

of plate current, which would equate to 15 watts of dissipation.
And that is within the rating of the tube.
Then they put only tubes withthe same numbers in a rig. So, by their
definition "matched" meant within 5 ma of each other.
If you have a rig that you are matching for, why not do the same, using
one tube at a time?

The battery is probably shot. A regular lead-acid battery is usually a
goner if
the voltage falls below 10 to 11 volts. I would expect the same of the
gel-cell.
It's worth a try running it on the charger for a while, but don't be
surprised
if it doesn't revive.
I wouldn't put diodes in the lines. The voltage drop may prevent you from
bringing the battery up to proper voltage even if it is still good. A
low-value

resistor or 12-V light bulb will moderate the current, and you can make
rough
current measurements by measuring the voltage drop across it (Ohm's Law:
I = E/R). The resistance of the light bulb will go up if the current is
very
high (bright bulb), so the measurements won't be accurate, but they're
cheap
and easy, and they give you a rough value.

Rich W2RG

Put a 12 volt light bulb in series with the power supply to limit the
charging current. When the light bulb goes out or gets real dim you
know
it's close to full charge.

From: kgoerg@webblabs.com
Message-ID: <3476140E.DE936EDD@webblabs.com>
Source record: 88872

Electrical and electronic engineers rely heavily on modern simulation and synthesis software. Sadly, effective usage of these tools is almost invariable restricted by one-user security schemes of one sort or another. Our breakthrough site licenses render other options obsolete.

For audio-to-microwave nodal circuit analysis, structure and filter synthesis, and system engineering support, the unprecedented Professional Partnership Program is the first true site-wide option. For details, see:

http://www.webblabs.com/pp.htm

If you are with a smaller firm, the alternatives to the PP Program are far more costly. If you represent a large company, your per-user cost will approach zero and there are no annual fees!

Our Education Partnership Program provides comparable benefits for engineering and electronics schools:

http://www.webblabs.com/ep.htm

# 4674. MFJ Hi-Q Loop Antenna Queries

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-21 00:00:00 UTC
From: "Joseph R. Romanosky" <saywhat@erols.com>
Message-ID: <347617A6.D93019D0@erols.com>
Source record: 88873
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.antenna,rec.radio.amateur.misc

Anyone have any experience using the MFJ Super Hi-Q loop (10-30 MHz)
or the 40-15M version? I have one of the original AEA Isoloop antennas,

so I have some experience using small transmitting loops....I am
considering purchasing an MFJ loop, but would like some feedback from
Hi-Q loop
owners first....

Also, any info on other manufacturers of small loops? My main goal is
to get on 40 and 30 meters...since I already have the AEA loop covering
20-10...

thanks 73

Off-Topic, but 4X150's are hot tubes. We had 2 in parallel in a Collins
UHF rig in the RCAF (Royal Canadian Air Force) back in the '60's.

The driver was amazingly feeble (I don't remember the driver tube after
all these years, but I was always surprised it could drive the 4X150's to
full output.)

Up on the DEW Line, I was cleaning the RF connectors on a rig, and an
idiot friend of mine keyed the mike and said "Hello Test".

I didn't feel a thing, but the arc off my finger went about an inch as I
janked it from the connector.

The RF burn went in deep, and took a long time to heal. I encouraged my
friend to never do that again.

It didn't hurt the 4X150's at all :)

I just finished a modulator design for L-Band Inmarsat use. The design incorporates a hybrid synthesizer using a 9850 DDS and a National PLL. It has very low phase noise and 1Hz resolution (.3Hz accuracy) from 55 to 85MHz. Neat as a pin.

Have a look at the Vintage Radio Kit Co. Web Page!!

http://www.mnsinc.com/bry/vintage.htm

See the new REGEN receiver and BREADPAN antenna tuner kits!

Who ever said kit-building was dead? Read all about the 5 watt Giant,
the "Cake Pan CW 5."

Cool stuff IMHO!

Actually guys, there is no need to pay those high JAN Crystals prices.
You can get them for less than the commercial type prices if you are
prepared to hunt a little!

Ny experience has been that VERY few crystals show up at hamfests any
more. I HAVE bought a few that way - usual;ly NOT in ft243 holders
though. Often I get HC-6/U types etc that way.

To buy the FT243s you should contact CW Crystals or some of the other
less expensive suppliers that cater to ham homebrewers.

Full details are at:

http://www.mnsinc.com/bry/mega/xtals.htm

Enjoy!

>> Hey guys,
>> What is DDS?
>> Mike
>>
>

I built the Fred Williams synthesizer that appeared in QST a number of years ago and in the ARRL Handbook for a few years. Although it is not as compact as more modern designs (it uses 2 circuit boards filled with chips) I have been extremely impressed with its performance. I improved the filtering on the output and redesigned the controller to use an 8751, which I felt was more versatile, and added a tuning dial circuit (2 speeds, I can change the frequency in 1 Hz steps or 100 Hz steps).

It seems to keep jumping from project to project of mine. I've been thinking of playing with frequency-hopping spread-spectrum using this circuit.

# 4689. HERE COME THE BUCKS . . .

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-21 00:00:00 UTC
From: meeeeee989@aol.com
Message-ID: <19971121123100.HAA00431@ladder02.news.aol.com>
Source record: 88966

DO YOU WANT TO MAKE BUCKS FAST???--AND NO ONE LOSES . . .
Of course you do, we all do !!! Here's how to do so with little effort, and, yes IT'S LEGAL.

Some people make things happen
Some watch things happen
While others wonder what has happened

This is the easiest way that you can make a buck. Think how excited you'll be to open up your mailbox day after day! Will it be $50 in dollar bills? or $5,000? Start making your plans, because it can happen to you.

DON'T PASS UP THIS ONCE IN A LIFETIME OPPORTUNITY!!! (I'm glad I didn't)

Like you're doing now, I was checking out newsgroups and came across an article similar to this that said you could make thousands of dollars within weeks, with only an initial investment of $6.00! So I thought, "Yeah, right, this must be a scam!", but, like most of us, I was curious; I kept reading.

Anyway, it said that if you send $1.00 to each of the 6 names and addresses stated in the article, you could make thousands in a very short period of time. You then place your own name and address at the bottom of the list at #6, and post the article to at least 200 newsgroups.(There are about 22,000.)

No catch, that was it. After thinking much about it, I came to the conclusion that this could not be a scam (but, if it was, only scamed out of $6 , I could afford it.)

Even though the investment was a measly $6, I had three questions that needed to be answered before I could get involved in this sort of thing. Just like you, I was skeptical, or thought it might take too much work or something.

1. Is this really legal? . . . I called a lawyer first. This lawyer friend was a little unbelieving that I would actually make any money but he said it WAS LEGAL if I wanted to try it. I told him it sounded a lot like a chain letter but the details of the system (SEE BELOW) actually made it a legitimate legal business.

2. Would the Post Office be ok with this . . . I called them: 1-800-725-2161 and they confirmed THIS IS ABSOLUTELY LEGAL! (See Title 18,h sections 1302 NS 1341 of Postal Lottery Laws). This clarifies the program of collecting names and addresses for a mailing list.

3. Is this moral? Well, everyone who sends me a buck has a good chance of getting A LOT of money . . . a much better chance than buying a lottery ticket!!! In the end it looks to me like no one loses, we help each other move ahead.

So, having these questions answered, I invested EXACTLY $7.92 ... six $1.00 bills and six 32 cent postage stamps . . . and boy am I glad I did !!!

Within 7 days, I started getting money in the mail! I was shocked! I still figured it would end soon, and didn't give it another thought. But the money just continued coming in. In my first week, I made about $20.00 to $30.00 dollars. By the end of the second week I had a mad total of $1,000.00 !!!!! In the third week I had over $10,000.00 and it was still growing. This is now my fourth week and I have made a total of just over $42,000.00 and it's still coming in . . . It's certainly worth $6.00 and 6 stamps !!!

So now I'm reposting this so I can make even more money! (and helping you to make a lot of money.) The *ONLY* thing stopping *ANYONE* from increasing their own bank account is pure laziness ! It took me all of 5 MINUTES to print this out, follow the directions, and begin posting to newsgroups. It took me a mere 45 minutes to post to over 200 newsgroups. And for this GRAND TOTAL investment of $7.92 (US) and under ONE HOUR of my time, I have reaped an incredible amount of money --like nothing I've ever even heard of anywhere before ! Enough said, time to start !

Let me tell you HOW this works, and most importantly, WHY it works. Also, make sure you print a copy of this article now, so you can get the information off of it when you need it. The process is very simple and consists of THREE easy steps:
STEP 1--Send the 6 people on the list a single dollar each.
STEP 2--Put your name and address on the list in position 6.
STEP 3--Post this amended letter to 200 (or more!) Newsgroups.

==========
HOW IT WORKS
==========

STEP 1:

Get 6 separate pieces of paper and write the following on each piece of paper:

PLEASE ADD ME TO YOUR MAILING LIST.
$1 US DOLLAR PROCESSING FEE IS INCLUDED.

(This is the key as this is what makes it legal since you are paying for and later offfering a service.)

Now get 6 $1.00 bills and place ONE bill inside EACH of the 6 pieces of paper so the bill will not be seen through the envelope to prevent theft/robbery. Then, place one paper in each of the 6 envelopes and seal them. You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase and a U.S. $1.00 bill. Now send to:

#1
JA Gualtieri
45-350 Columbia St. W.
Waterloo, ON, Canada N2L 6G3

#2
Andrew Wiggin

PO BOX 424
East Setauket, NY 11733

#3
Ashle
347 Jamboree
Manchester, MO 63021

#4
The Mom
4464 Castelar Street, #320
San Diego, CA 92107

#5
Chris Watson
1138 Indian Road
Virginia Beach, VA 23451

#6
Virgil
3538 West 12th Street
Trainer, PA 19061-5301

STEP 2: Now delete name #1, move the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR name as number 6 on the list. (If you want to remain anonymous, put a nickname, but the address MUST be correct, or you won't receive your dollars in the mail.)

STEP 3: Now post your amended article to at least 200 newsgroups. Remember, 200 postings is just a guideline. The more you post, the more money you make! As you might know, it's not that difficult to post to news groups. So, you don't know HOW to post in the news groups? Well, do exactly the following:
---
HOW TO POST TO NEWSGROUPS FAST WITH YOUR WEB BROWSER:

Highlight and COPY(Ctrl-C) the text of this posted message and PASTE(Ctrl-V) it into a plain text editor (like Wordpad or WordPerfect) and save it. After you have made the necessary changes that are stated above, simply select a newsgroup then COPY(Ctrl-C) and PASTE(Ctrl-V) the text into the message composition window of the newsgroup, and post it!
---
GENERAL NOTES ON POSTING: A nice page where you'll find all the newsgroups if you want help is http://www.liszt.com/ (When you go to the home page, click on the link 'Newsgroup Directory'). But I don't think you'll have any problem posting because it's very easy once you've found the newsgroups. All these web browsers are similar. It doesn't matter which one you have (But it makes it very easy if you have Netscape Navigator 3.0 or later. You may download it from the Internet if you don't have it.) You just have to remember the basic steps, stated below.

BASIC STEPS FOR POSTING:
1. Find a newsgroup and you click on it.
2. You click on 'POST AN/NEW ARTICLE' or 'TO NEWS' or anything else similar to

these.
3. You type your flashy headline in the subject box.
4. Now, either you attach the file containing your amended letter, or you PASTE the letter.(You have to COPY it from the text editor, of course, from before.)
5. Finally, you click on 'SEND' or 'POST' or 'OK', whatever is there.
---
**REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200**

That's it! You will begin receiving money from around the world within day's! You may eventually want to rent a P.O. Box due to the large amount of mail you receive. If you wish to stay anonymous, you can invent a name to use, as long as the postman will deliver it.

**JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.**

==========
Now the WHY part:
==========
Out of 200 postings, say I receive only 5 replies (a very low example). So then I made $5.00 with my name at #6 on the letter. Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #5 and only 5 persons respond to each of the original 5, that is another $25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #4 and only 5 replies each, I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #3 and only receive 5 replies each, I will make an additional $626.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM 200 letters with my name at #2 and they each only receive 5 replies, that just made me $3,125.00!!! Those 3,125 persons will all deliver this message to 200 newsgroups with my name at #1 and if still 5 persons per 200 newsgroups react I will receive $15,625.00! With a original investment of only $6.00! AMAZING! And as I said 5 responses is actually VERY LOW! Average is probable 20 to 30!

So lets put those figures at just 15 responses you get. Here is what you will make:

at #6 $15.00

at #5 $225.00

at #4 $3,375.00

at #3 $50,625.00

at #2 $759,375.00

at #1 $11,390,625.00

When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $6.00 to names on the list, putting your name at number 6 again. And start posting again. The thing to remember is, do you realize that thousands of people all over the world are joining the internet and reading these articles everyday, JUST LIKE YOU are now!! So can

you afford $6.00 and see if it really works?? I think so...

People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the internet and newsgroups everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual internet. Remember, play FAIRLY and HONESTLY and this will work. We all just have to be honest and help each other get ahead.

REMEMBER-HONESTY IS THE BEST POLICY. WHAT ARE 6 DOLLARS TO YOU? YOU DON'T NEED TO CHEAT THIS IDEA TO MAKE MONEY!!! IF YOU NEEDTHE $6, I'M SURE ANY OF THE PEOPLE ON THE LIST AHEAD OF YOU WOULD SEND YOU $6 IN DOLLAR BILLS TO GET GOING--YOU HAVE NOTHING TO LOSE !!

** We will monitor the program and if we find you have cheated by not sending your money to your five recipients, we will just dump you out of the system. Come on folks, let's work together and make this work for everyone.

GOOD LUCK to all and please play fairly and reap the huge rewards from this, which is tons of extra CASH.

Please remember to declare your extra income. Thanks once again...

Fascinating. I ran into that character and remark in Kurt
Vonnegut's "Cat's Cradle". Unfortunately, the ability of computers
to make a bad index quick-and-cheap has destroyed the market for
professional indexers. Anyway, it is true, to make a good index
requires the use of a good thesaurus. Most software help systems
will tell you all about a command you found on a menu, but won't
help you find it if you don't know WHICH verb/noun they CHOSE to
use, and book indices these days are lacking in the nice little
cross-references (modulators: see mixers) that help you find things.

Source record: 88880

What frequency?

At VHF, you can drive a 4X150 to full output with a watt or two when driving the grid. I had to build a resistive attenuator to go from say 15W down to 2W on 144 and 220 MHZ.

My favorite method is to switch the screen grid supply to turn the tube on/off. Grid bias is on all the time. It is good to have a mercury-wetted relay for this, but it's not a big deal. You need to take the screen to ground when you want the tube off. I switch the screen to a 1K resistor to ground with the relay. Have three amps all running from same power supply and they work fine driving the grid and switching the screen on/off.

Some will tell you you will have problems with neutralizing when driving the grid, but I haven't seen it. Also have Gonset amp on 6M. It is grid driven, but switches grid bias to turn tube on/off. All amps use 4X150 or 4CX250.

Regards,

Bill

# 4700. Fussy AF amp @ N2CQR

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-22 00:00:00 UTC
From: wmeara@erols.com
Message-ID: <34774345.360090606@news.erols.com>
Source record: 88886

Progress on my 30 meter direct conversion transceiver was temporarily slowed by family responsibilities, but I am now back at the work bench. { I've taken a simple 5 Watt VXO controlled transmitter and paired it up with a Sudden RX from Kanga (602 and 386) and am using a second 386 chip from a Kanga sidetone board for some additional audio amplification (and sidetone).} Words of wisdom from cyberspace led me to reduce the amount of coupling from the transmitter's VXO to the local oscillator input on the NE602 chip. (Thanks Harry!) This eliminated most of the annoying "popping and squealing" that I'd experienced whenever I turned the main tuning cap. I put some additional capacitance in parallel with the main tuning cap to eliminate some weird noises that I got at the "min cap" position.

I worked out a real "kludge" fix for my audio amp oscillation problem: I got one of those cheap little Radio Shack computer speaker sets. they have some audio amplification circuitry in one of the speakers. When I use this speaker with the active devices on, I get no feedback. With the same speaker connected, If I put the switch in the "speaker only (no amp) position, I get frantic motorboating! I get the same motorboating if I connect a ordinary 8 ohm speaker to the output.

Any ideas on what is going on here? Could it be that the input impedance of the speaker (with Amp in circuit) is preventing the motorboating? How can I get the same result with only a speaker in the circuit?

Thanks, 73, N2CQR

That is a irrational statement here. I dare say that 75% of all QSO's
on the amatuer band are CW. All you have proven as that in the W1 QSL
bureau most hams that send QSL cards use CW. That is all, nothing
more or nothing less.
Just because he sees more QSL cards are for CW contacts, he make the
assumption that more contacts are via CW. That's like asking the
general public if they like carrots. If only the ones who reply are
the ones who hate carrots. You make an assuption that most people
don't like carrots. Something like a straw poll. Not worth a tinkers
D$%$^#.
>
>For those of you who will take exception to the "CW requirement" for the
>internet...Lighten up or get a life!

I ask what is the relavence of proficiency in one form of
communications a mandate to priviledges that are not even related to
this mode of communicatoins?
Does it mean that someone who doesn't like one aspect of amatuer radio
should not have priviledges in another area?
Do you subscribe to the theory that I had to do it so everyone else
after me must also?
I wonder if someone jumped off a bridge, would you?

Oh no one of those! Likes to keep his ball and not let anyone else
share unless they meet up to their expectations.

A smaller amatuer radio market will mean ever higher costs for new
equipment. Smaller numbers also mean less political muscle when it
comes to attacks on the bands that are already in use. To those
amatuer operators that subscribe to the 1920's, the times are a
changing. I would not be suprised if more of the UHF and higher bands
come under attack from commercial interests. These people have power
and if the population of the amatuer service remains the same or
dwindles the hobby will also. It is estimated the frequencies
assigned to the amatuer band exclusively would bring to the federal
government about 30 to 60 BILLION dollars based on the last PCS
auction inthe 900 MHZ range. That's alot bucks there for politicians
to spend. Numbers in any radio service acan help to fight the money
grabbing poloticians and commercial interests that stand to make more
than the frequencies are wortth.

That's my penny's worth

Hi James, there is a logical explaination. CW is so inefficient as
a communications mode, that everyone has to resort to snail mail
to finish their QSOs. :-)

I have a couple of large roller inductors (different sizes). I'd like to build an
antenna tuner for my 200 foot per side doublet antenna that is fed with 450 open line.
What design should be optimum?
What components are required for a full power 160-10 meter tuner (6 would be a bonus).
I understand that a (commercial) true open line antenna tuner is rare and costly.

Hello Jan,

I have attached 3 image files.
-files not inc. -ref outfit is Communications Concepts, Inc. ....
They are from a catalog I have. I once
bought a 900 Mhz down converter from this company and was very
satisfied. The company (order form is image 1) sells boards and parts
needed to build the amps. The other two images show two amps they sell
parts for. If you only want the data, look at the bottom of the image -
for the transistor maker's application bulletin number and contact them
for a copy. (AR305 & AR347)

# 4716. LF Rx and DGPS

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-23 00:00:00 UTC
From: Paul Breed <Paul@rasdoc.com>
Message-ID: <34786CB1.37128CB7@rasdoc.com>
Source record: 88820

I am about to homebrew a LF rx for recieving the CG DGPS transmissions.

The background:
The DGPS transmissions are:
282->325 Khz.
MSK modulated at 100 or 200bps (MSK - minimum shift keying)

I am an engineer with lots of digital and software experience, some
analog, and very little RF design experience.

My idea for a design is as follows: (Sorry no ASCII Art.)
908
Do an I/Q direct conversion Reciever.
Followed by an amplifier Low pass filter and A/D on each I/Q channel.
A low end DSP part would then decode the MSK from the I/Q.
(I know how to do the DSP and MSK Decode if I can get baseband I/Q)
If any one wants some sample code send mail.

Since all of the Gain is at AF frequencies how much problem will I have
with:
Microphonics?
Syncronizing the Gain between the I/Q ?

This allows me to use a very simple 1.1Mhz to 1.3Mhz PLL , or fixed
crystal as my only LO.
(The LO needs to be 4x the Rx so I can generate the 90deg shift easily.)

Is this idea brain dead?
Should I include some RF amplifcation ahead of the mixer?

If I want to do a fixed frequency version where can I get crystals at
specified frequenies?

Also can anyone help me with a loopstick antenna for this freq range?

The alternative is to do a multiconversion design:
If I do a multiconversion design there are lots of image problems from
the broadcast band.
To kill these images I would need to do an Up-conversion to 10.7M (Where
lots of cheap filters are availible)
then do an I/Q downconversion to the DSP part.
This has a lot more "RF" parts. The first and second LO, an IF filter
and a IF amp stage.

Thanks

Paul.

# 4717. Re: 885.25 MHz Oscillator, (Ch.83 video)

Several years ago, I hd the opportunity to track down some
interference to a 470 MHz community repeater in Miami. The
interference had a strange emmission and contained background music
and random conversations. The interference led me to a sandwich shop
in Liberty City (high crime area), where I discovered a UHF yagi
attached to the side of the building. Upon questioning the proprietor,
who must have thought I was with the FCC, he requested "immunity from
prosecution". Turns out he had rigged up a video camera and mcrophone
in the place to catch on-going burglaries and was beaming the signal
(channel 14) back to his nearby apartment. The transmitter was a
"Hawkeye" device sold in Miami for "export only". I suggested he
string a coax cable accross the street. The signal went away the next
day never to return.

# 4718. Hallicrafters S-53A- any advice?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-23 00:00:00 UTC
From: Michael Salmons <msalmons@voyager.apg.more.net>
Message-ID: <65a175$d1$1@news.more.net>
Source record: 88822
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew,rec.audio.tubes

Hello,

I have a Hallicrafters S-53A in pretty good shape. It has all original tubes (which are still working well, I think). I have had to replace the speaker, but that's it. I would like to upgrade some parts to improve its performance in general, and its resistance to drift and an increase in sensitivity, specifically. Is this a feasible goal with this unit? Can anyone suggest any upgrades or modifications to achieve this goal?

I am also interested in general info about this model- when it came out, whether its top or bottom of the line, etc. Any info would be appreciated. I really like the ergonomics of this model and am resisting upgrading to a newer radio.
If I should really be using another model from this period or style, I would be interested in that as well.

If it helps, in general, I prefer listening to the major international broadcasters and some tropical band stuff and live in the midwestern US.

Thanks!

Michael Salmons

Source record: 88829
Cross-posted to: alt.ham-radio,rec.radio.amateur,rec.radio.amateur.homebrew,uk.radio.amateur

I have recently acquired a 2valve/3waveband radio, which seems to date fron the '50s. It appears to have been built from a kit and has 'Premier Radio' on the tuning dial. It is of simple constuction based on an aluminium front panel with two sub-chasses for the coils and valves respectively. The controls consist of an uncalibrated tuning dial, ? reaction, ? aerial trimmer, a volume control and waveband/on-off switch. The valves (octal base and aluminised) are Ex.WD, only one is marked (VR130A), appear to have 6.3v heaters. Screw terminals for aerial, earth and headphones are on the front panel. My example has been built into a metal (approx 150x150x150cm), Ex WD valve box with a hinged lid.
Does this ring any bells with anyone? I would very much appreciate any info, HT/LT voltages, circuit data, reminiscences etc, mainly because I am itching to fire it up.

Source record: 88831

Unfortunately, I would imagine that we would get no advertisers. Major manufacturers do not want $100 projects that show how crappy their $5000 designs are in comparison.

My guess is that the "big three" would probably pay people not to to contribute :)

Hmmmm, i wonder if that's why there aren't many projects that don't require you to have expensive equipment or learn CW... [Removing tongue from cheek] Alas, at this point, it seems that no-coders are kinda stuck with FM if they aren't affluent or want to learn CW. I've been watching prices on VHF/UHF SSB/CW gear, and very little seems to be much under four figures these days.

Officially it is transformer oil. Most common is mineral
oil from the pharmacy. Vegetable oil would work but is
likely to go rancid on you.

Best, Dan.

The best stuff to use is called "transformer oil", and it's what they
fill (surprise) transformers with. I bought some years ago from the
local Shell distributor and it works fine. Check the yellow pages for
oil distributors. They probably have a minimum quantity of five
gallons, but the leftover could be easily sold.

# 4747. Heavy Duty Roller Inductors - Sell or Trade

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-24 00:00:00 UTC
From: DavidC <davidc@bit-net.com>
Message-ID: <01bcf887$69be8be0$098a92d0@bitnet.bit-net.com>
Source record: 88833
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.homebrew,rec.radio.swap

Trade or Sell: I have some large roller inductors that I was going to assemble into a heavy duty antenna tuner - time is killing that project off!

1. Rotary inductor on 3.5" X 7" porcelain form. Coil is 23 turns of 0.125" dia. silver plated wire. Inductor is supported by a 4.5" wide X 5.5" high X 9.5" deep frame that is designed for chassis mounting. This is a beautiful rotary inductor. Shaft is 0.125" diameter. (asking $35.)

2. Motor driven rotary inductor CU-351/AR. 3.25" X 5" porcelain form. Coil is 25 turns of 0.125" wide silver-plated ribbon. Motor winds ribbon from porcelain form to separate metal drum. Great for remote antenna tuning. Motor is 27 VDC. Inductor frame is 4" wide X 6" high X 9.5" deep. (asking $45)

3. Rotary inductor on 2.38" X 7" insulite form. Coil is 30 turns of 0.125" diameter silver plated wire. Inductor is supported by a 3" wide X 3.5" high X 8" frame which can be chassis or panel mounted. Form is somewhat melted under the last 3 coil turns but inductor operation for the other turns is not affected. Repairs (peeling back the wire 3 turns and trimming the bubbled insulate, then rolling the wire back) are needed for the roller to access these 3 turns. (asking $25.) Asking prices are plus shipping. Will sell all 3 inductors for $100. shipped, just to save the hassle and expense of shipping the three separately.

Wanted:
1. 200 feet new buriable Belden 9913 equivalent (something not as prone

to siphon water - good to 450mHz)
2. 500 feet of Dacron rope (double strand ultraviolet protected black high

strength)
3. Two lengths of Rohn 25 (one straight, one tapered)
4. Power Supply for Multi-Elmac PRC-6, AF-67, AF-68
5. Amplified PC Speaker system with subwoofer
6. Older wood cabinet am/shortwave receiver (not hacked, all parts present, prefer it show some signs of life!)
7. Cartridges for my Canon BJC-4300 printer
(BCI-21 Black, BCI-21 Color, BC-20 Black, BC-22e Photo, BC-29F Neon IS-22 Color Image Scanner Cartridge)
8. Zoom lens for old Konica Autoreflex 35mm SLR
9. Antenna switch, full power, good to 440mHz
10. 3 gig HDD
11. IEEE Printer Cable (6-12 feet)

>
>China Sucks. Everything made there is pure crap. The military there
>stinks of feces. I won't help participate in your labor camps.

What an intelligent, obviously well-thought-out reply "nobody". I truly believe everyone should cast their 2 cents into the fray in this country... it is one of the things that differentiates us from countries where such things could cost one 10 years in a "re-education" camp.

HOWEVER... at least have sufficient courage of your convictions to sign your name to them. I would suggest you knew your tasteless remarks were themselves made of what you mention: crap... and that was why you feared identification with those words.

Don't you believe that we can reach out to the non-Democracies and win them through exposure to capitalism? YES there are some deplorable things going on in China... sweatshops and the like... but there are many many such sweatshops in New York City (for one) to this very day. Are you refusing to buy shirts labeled "Made In USA"? Of course not.

The difference is that we have laws against such practices, and have had for many years. Not always however. It takes time for a country to grow into maturity, equity, and responsibility to all its citizens. We TRY to eliminate such practices. But how many crystal manufacturing sweatshops have you heard of? Are THESE specific people responsible for the other uncivilized things occuring there? Probably not. Should we ignore them and their attempts towards capitalism? Is it their government that succeeds when these entrepreneurs succeed? I think not. Their success and example only stimulates further growth, using our philosophies-not the official government line. How can that do anything but help?

Would you have us ignore China entirely? We've tried that with Cuba, and the only thing that has accomplished in the past 40 years is the serious deprivation of the Cuban people of more than luxuries, but rather of medicines and food-which I also deplore. I doubt Fidel has gone hungry even one day.

It is not in the interests of Democracy for us to try and force our beliefs down a country's throat. The attractions of our Western standard of living and many freedoms will surely overcome despots everywhere, one by one, sooner or later. Remarks like yours however, help not one whit.

WARNING, I tried these rechargable alkalines when they first came out. To try and save some bucks, I didn't buy the Rayovac Recharger unit. Big Mistake !! I tried to charge the first alkalines in an old Ni-Cad recharger (wall wart type) I had and the two (or 4 ??) AA batteries leaked all over everything and the chemical leak even destroyed the Ni-Cad Wall charger itself. I just glad I didn't first put the rechargable alkalines into one of my good radios that automatically recharge Ni-Cad's !!!

When Rayovac states on their package to "Only use Rayovac Alkaline Rechargable battery rechargers", YOU BETTER BELIEVE IT !! After getting the Rayovac recharger (charges 8 batteries at at time), I have had great luck with the batteries. They charge up to around 1.7V per cell (no load) and seem to last longer that the Ni-Cad batteries. Just DON'T put

them into any gear that recharges the batteries BESIDES the Rayovac recharger!!

I have to support this - if you look in a Murata filter catalog, for example, you will find filters with centre frequencies at 888.5 and 881.5MHz, either of which you could build a nice stable oscillator round. However, the application of these filters is for the E-TACS and E-AMPS cellular systems, so you are likely to get a rapid visit from some _seriously_ annoyed folk if you transmit in this band.

Cheers
Ian Buckner

That's an interesting observation, Gary. How about combining the two approaches, using a negative feedback circuit to control the level of positive feedback? It seems to me that with today's technology we could design a regenerative detector that was automatically kept just below or above the threshold of oscillation, as required for the mode we wanted to listen to, with no critical adjustments needed in either production or use. Have you heard of any such design? I can't be the first to have thought of it.

Wow, that would be a change. I remember my first regen, built from a kit in about 1953. The regeneration was controlled by a moveable tickler coil. I used toothpicks to attempt to maintain the coil in the critical position, once found. It was barely usable for broadcast listening. When I swapped in the short wave coils and tried to listen to hams it was barely possible to control on 80 meters, almost impossible on 40 and 20.

# 4756. Sell or Trade: Roller Inductors

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-24 00:00:00 UTC
From: DavidC <davidc@bit-net.com>
Message-ID: <01bcf86e$1f3fd7e0$098a92d0@bitnet.bit-net.com>
Source record: 88842
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.homebrew,rec.radio.swap

I would like to trade or sell the following:

Are you a homebrewer? I have some large roller inductors that I was going to assemble into a heavy duty antenna tuner - time is killing that project off!

Rotary inductor on 3.5" X 7" porcelain form. Coil is 23 turns of 0.125" dia. silver plated wire. Inductor is supported by a 4.5" wide X 5.5"
high X 9.5" deep frame that is designed for chassis mounting. This is a beautiful rotary inductor. Shaft is 0.125" diameter. (asking $35.)

Motor driven rotary inductor CU-351/AR. 3.25" X 5" porcelain form. Coil is 25 turns of 0.125" wide silver-plated ribbon. Motor winds ribbon from porcelain form to separate metal drum. Great for remote antenna tuning. Motor is 27 VDC. Inductor frame is 4" wide X 6" high X 9.5" deep. (asking $45)

Rotary inductor on 2.38" X 7" insulite form. Coil is 30 turns of 0.125" diameter silver plated wire. Inductor is supported by a 3" wide X 3.5" high X 8" frame which can be chassis or panel mounted. Form is somewhat melted under the last 3 coil turns but inductor operation for the other turns is not affected. Repairs (peeling back the wire 3 turns and trimming the bubbled insulate, then rolling the wire back) are needed for the roller to access these 3 turns. (asking $25.)

Asking prices are plus shipping.
Will sell all 3 inductors for $100. shipped, just to save the hassle and expense of shipping the three separately.

Need: 200 feet new buriable Belden 9913 equivalent (something not as prone to siphon water - good to 450mHz), also need 500 feet of Dacron rope (double strand ultraviolet protected black high strength), two lengths of Rohn 25 (one straight, one tapered), Power Supply for Multi-Elmac PRC-6, AF-67, AF-68, Amplified PC Speaker system with subwoofer ... or offer something else you may have to trade!

David,

How about the Balanced-Balanced tuner by Rich Measures (AG6K) that is
described
in December 1990 QST? It uses two roller inductors and a single variable
capacitor.
I am building one now too.

Also look at the Novice Notes Online Page (URL below) - Links section - under "Antennas" for a few links on magnetic loop antennas.

I use a homebrew 1.5m square loop indoors for 80 & 40m and it works very well considering its size.

To me $75 seems reasonable for a QRP transceiver kit, but only if it's frequency-agile and has a reasonable receiver.

Re your query on apartment antennas, look at the latest Novice Notes column that has been posted on "Novice Notes Online" (URL below). That column is all about antennas for people in your situation.

The best indoor antenna I've built is a magnetic loop. It is 1.5m square and works on both 80 & 40m. It should be OK for QRP on 40m (I normally use 20 watts) but if it can be made bigger, that's for the better. See the Novice Notes Online Links section for all the info I needed to build my version.

Hope this helps.

>

You've identified a perfect niche for direct conversion DSB/CW gear, probably using a VXO and multipliers. Solid State Design provides info on gear for 6 and 2m (transmitters only) but there seems to have been little written since then.

Also DSB on 10m is a possibility. It is not out of the bounds of possibility that people could build their own 28 Mhz handheld transceiver. A few nights ago during a sporadic-E opening, I had 10 QSOs (mostly interstate and up to 1500-2000km distant) with 12 watts SSB from a modified CB used pedestrian mobile! A 5 watt DSB handheld could have made many of those contacts.

I've been working on an unusual 1 transistor VXO circuit that covers 28.420 - 28.500 MHz in a single range. It was designed by LZ1BB (for 3.5 MHz) with changes by VK1PK. Basically you start with a normal colpitts VXO. In my case I used 10.240 MHz xtals - easily obtainable from ex-commercial VHF transceivers. Then put a second xtal in parallel to increase the freq shift (as per the JA "Super VXO" circuit. You should get about 80 kHz shift.

Now here's the ingenious bit. From the base of the transistor to earth, wire a 18.3 MHz (or thereabouts) crystal. Also take the output (from the emitter) through a small capacitor and couple it to a tuned circuit on 28 Mhz. Would you believe that there is in fact a tunable output on 28 MHz? Somehow the one transistor works as two oscillators and a mixer - all in one! This could be a good basis for an 10m DSB rig.

Indeed! I sent some comments about Ham Radio 12/77 article to cure
Drake R-4C problems, the article was written by representatives at a
wellknown xtal filter manufacturer. The editor did not dare to print
my comments, where I show that a few conclusions were wrong.
1) With all connections broken between BFO and the old product
detector - still it is bad interference pattern to be seen on IF
output with oscilloscope, so an MC1496 (or any other) would not
improve this problem
2) with the audio amplifier modification this would oscillate on
1,5MHz
.....
but few weeks later I received very much information about xtal
filters and other facilities to improve my Drake R-4C !!

I had much better luck following W5DA's instructions ('73' June 79)

Source record: 88848
Cross-posted to:
rec.radio.amateur.misc,rec.radio.amateur.homebrew,rec.radio.amateur.antenna,rec.radio.amateur.dx,rec.radio.amateur.equipment

The Cherokee AH-100 SSB handheld makes a great little 10 meter sideband rig. The price just dropped to US$214. It comes with a mobile adapter (MA100) that replaces the battery pack. The MA100 has a single coiled cord that ends in an SO-239 and cig lighter plug. This turns it into an all-in-the-mic mobile rig.

7Watts PEP. AM/SSB. It's fun working "handheld DX" with it when the band is open, using a WTA-1 Maxon telescopic whip.

Has anyone done the simple 12 meter mod yet?

When will ICOM, Kenwood, Yaesu, or Alinco, etc, jump in, using their already-tooled cases and battery packs, to bring out a 20, 17, 15, 12, or 10 meter handheld?
They could just start with a 10m and/or 15m SSB/(FM)/CW unit; with the rising DX conditions and the increase in activity.
Next: How about an HF all band handheld? Companion antenna could provide filtering.

Pulse charging produces a mechanically bettery replating of the electrode
so it is preferable to continuous charging. I believe this is true for
NiCds as well as alkaline batteries.

The real reason you can't use a NiCd charger for alkaline cells is that
the alkalines absolutely will not tolerate overcharge without damage.
Charging must stop at full charge. You can use pulse charging, or you
can use a regulated 1.65 V voltage. The latter is slower and doesn't
do as good a job, but it works fine. Pure Energy sells rechargeable
alkalines and two different chargers. One is pulse, the other is
constant voltage.

NiCds, on the other hand, are built to accept overcharge for long periods
if it is at a low rate (C/10 or less). This allows them to be charged
as a series string, with the cells that reach full charge first just
sitting there undamaged by the overcharge as the other cells come up to
full charge. You couldn't do this with alkalines - they have to be
charged individually, with a charging circuit per cell (like RayOVac does)
or at least with all cells in parallel (like Pure Energy).

In addition to the RayOVac web site, you might also want to look at
http://www.bti.ca. BTI is the company that developed the technology
in the first place, and there is a lot of useful data on their web site.

Hello--
Are you switching only one of the speaker's two leads? If so, the return lead may provide the feedback or ground-loop path. Install a DPDT switch and see if the problem goes away.

> Allan VE6XK

Folks,..... there is nothing magic about cooling oil for dummy loads.

All it is is a heat dissipator. Just size accordingly. It will get
warm if sized too low, but it will not generally burn or so anything
strange at usual ham powers.

Good old plain dime-store mineral oil or good old 10/20/20/40wt motor
oil from the grocery or quickiemart works fine. Change it every
couple of years. Synthetic oil would probably be more stable in
the long term --- Mobil 1 or such. ATF should work, too.

If you put a good blower on the dummy load resistor, you probably
don't even need the oil. Mil dummy loads are often blower cooled
rather than oil cooled. For the average length of time under load,
very small resistors will dissipate sufficient heat to work well.
All you need to do is move the heat load away from the resistors.
How you do it is mostly irrelevant --- air, oil, water, ambient
radiation, whatever.

For reference, and a cheap 200 watt dummy load, use a 200 watt lamp.
Most anything from a 60 watter to a 200 watter will work fine for
testing purposes, and the average rice box rig that puts out around
100 watts can use a pair of 75 watters in parallel if your worried
about the heat load. There are tables of lamp resistances that
you can find in the literature if you want to be more exact.
On the HF bands, it works fine, is cheap, and presents no real

inductive problem, contrary to popular belief. Also you can see it loading up. I have been using them for almost 30 years, and and have not had any problems on rigs up to 500 watts output. For comparative reference, the Navy recommended 500 watt mazda lamps for their larger ship/shore transmitters such as the TBK, for use as a dummy load. Some rice boxes tend to be a bit problematic with lamp loads, but most work fine. You can even put a lamp in a paint can, and drill a few holes for visual readout and minor heat dissipation, if you want to get exotic, and be well-shielded.

Your mileage may vary, but I tend to laugh at the wierd science that winds up in dummy loads. At vhf and above, it can make a difference, but at normal ham HF, it is mostly irrelevant. Think of what frequency you are working, and what a dummy load is, and fix to suit. Tolerances are quite broad in dummy loads --- anything from 30-100 ohms works fine. 50+-5 even for purists is fine at HF and even vhf.

Have fun, but dont get too worried about the oiling requirements for your dummy load. Most anything will work.

My name is Eric and I am looking to buy any radio tubes. If you are retired

from repairing radios and have a bunch of tubes left over, I would like to talk to you so I can make an offer. You can EMAIL me or call me on the phone

at: 250-868-1182 in Kelowna BC Canada in voice or fax.
You can email me a list of what you have and we could dicker a price from that.
Thank you for your consideration. Eric Pirtyak..VE7BWP..

Mike,

The next time you're about to throw a piece of HP test equipment away
because of a power supply problem you "cannot track down", please send
me a note at the above e-mail address (removing the anti-spam part
first).

I'll gladly pay for the shipping and even throw in a reasonable handling
charge to compensate you for your trouble.

thanks -- jm (de KE5FX)

A bit like asking how long is a piece of string! Could you be more
specific - ie input frequency, output frequency, desired RF power output?

# 4788. 28VAC Rotors Questions

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-25 00:00:00 UTC
From: jjeffers@deskmedia.com.remove.these
Message-ID: <65fsik$7gn$1@shadow.skypoint.net>
Source record: 88784

Hello Everyone - I've aquired a couple of typical TV antenna rotors and I intend to make an AZ / EL rotor out of them. I only have one control box which is very bad shape (it will turn the rotor, but makes an terible smell...) I've measured the voltage across this, and it shows up @ 28VAC.

What I need a typical pinout of a rotor (these have 4 wires). I popped one apart and it seems to have a switch of sorts (I'd assume to prevent the rotor from turn > 360 degrees.) and a open motor. There is 4 windings on the motor, but they connect to three different pins. It has me a little stumped.

Once I can figure out the pinout on these things, and get them turning on a power supply I intend to make a computer interface for them. (I'm imagining a parrell port interface, hooked to one of my linux boxes). I have little knowledge in electronics, so I intend to make a simple controller that has a couple of transitors and discret components. Would I be best off turning these things on and off with some high-power transistors, or should I use some MP2222A's to pull some automotive relays? If the earlier, can you please recomend one?

Any advice on my winter project would be much appreciated!

> -Jim Jefferson KB0THN

TV Rotor motors are typically 2 phase AC motors. They have 3 wires, one is common, and the other two have AC at 0 and 90 degree phase shifted respectfully. The AC is phase shifted by about 90 degrees with a large capacitor (typically 100-200 uf non polarized electrolytic). The usual configuration is to place the capacitor across the two phase wires and apply the 28 volts AC to one wire or the other depending on which direction you select. The capacitor automatically give the 90 deg phase shift to the opposite wire.

As for computer control, you may find that relays would be much simplier than trying to switch AC power with semiconductors. If you want/have to use semiconductors, then triacs would be the way to go with optocoupler trigger interfaces.

Good luck with your project.

Don't think these tubes were designed for grounded grid use although I have seen a schematic for it. The screen was grounded and the grid tied to the cathode. They are easy to get to work driving the the grid though. Swamp the grid with 2000 ohms or less and you will never have to worry about neutralizing it unless you do something really sloppy.

>Jim <jsides@flash.net wrote:

>When Rayovac states on their package to "Only use Rayovac Alkaline Rechargable battery rechargers", YOU BETTER BELIEVE IT !!

Yes sir, Jim. The Rayovac web site indicates that the correct way to charge these batteries is to charge at a rather high current level, stop the charge, check the cell voltage and repeat the process until the cells maintain 1.65 volts. Then the charging is complete.

So, the charging should be done by pulsing the cells and NOT continuous charging as with nicads.

I have seen the chargers for less than $20, which is not bad for a charger that can handle 8 cells (from size AAA to D) at once.

Regards,

Bill

Note: on the Rayovac site go to the OEM section to get the real skinny. The other stuff belongs in a commercial!

No, its doesn't matter after the 3 firsts.
> Can they be damaged by temperature extremes?
Yes, as NiCd and NiMH
> Can they be floated for
> long periods without damage?
Yes, they can, if no current (less than 1uA) is fed from them.

> What type of charging do they like(constant voltage, constant current, > neither)?

Constant voltage (with very good accurate), limited current (max is
about the nominal charge, e.g. 600mAh, 600 mA max of charge current),
and time-out circuitery.

> Thanks
> Allan VE6XK

Hope it'll help you.

Vincent.

Hi! I have for sale 2 8791 used power tubes(check like new)
they do the same job as the 4cx1000 but need differents sockets
they come with all the datas and infos.
Asking: $200.00 can.

If interested contact me at: PH/FAX: (250)868-1182 Thanks ....Eric

From: Bob Miller <bmiller@calweb.com>
Message-ID: <347BE5CC.3F24B8CC@calweb.com>
Source record: 88794

Hi Mates,
Just received a box of 100Ufd/450 volt electrolytics from Mouser Electronics. These are American made CDE 380LX series units rated at 85 degrees C and are of the snap mount can variety. They are not specified as energy storage or Photo Flash caps. My question is how did they make 'em so small? These rascals are not much larger than my thumb, about 25mm diameter and maybe 30 mm tall. I am not complaining as they are fairly inexpensive as well, but as I am overhauling a half dozen or so tube transceive AC power supplies for Swans and Galaxies etc, I am curious if any of you folks have had any experience with these smaller form factor capacitors in medium voltage circuits and especially voltage doublers in the 600-700 volt range.
Tnx

Bob, KE6F

If you're looking to get on 6M or 2M, the TEN-TEC transverters would seem
a good choice. A buddy has the 6M version and it works great so I assume
the 2M would be just as good or better.

Now just put it into a sardine tin and you've got a real QST technical article.

Close. At least the tradition at the Norcal QRP club is to put it in an Altoids box. I have a box waiting ...

I've been working on an unusual 1 transistor VXO circuit that covers 28.420 - 28.500 MHz in a single range. It was designed by LZ1BB (for 3.5 MHz) with changes by VK1PK. Basically you start with a normal colpitts VXO. In my case I used 10.240 MHz xtals - easily obtainable from ex-commercial VHF transceivers. Then put a second xtal in parallel to increase the freq shift (as per the JA "Super VXO" circuit. You should get about 80 kHz shift.

Now here's the ingenious bit. From the base of the transistor to earth, wire a 18.3 MHz (or thereabouts) crystal. Also take the output (from the emitter) through a small capacitor and couple it to a tuned circuit on 28 Mhz. Would you believe that there is in fact a tunable output on 28 MHz? Somehow the one transistor works as two oscillators and a mixer - all in one! This could be a good basis for an 10m DSB rig.

Could you do this with a 40 MHz microprocessor crystal? What about using two active devices and a "10.7 MHz" ceramic resonator to increase the frequency shift?

Drawings, please! [Either ASCII graphics or URL, no attachments, please]

## 4818. Tapped Inductors

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-26 00:00:00 UTC
From: stras@spark28.ecf
Message-ID: <wkgd8jnuvkp.fsf@spark28.ecf>
Source record: 88804

I've been looking at a number of RF circuits, and I quite often see inductors with taps (centre and otherwise). Now, the electronics course that I took didn't cover this sort of situation, and neither have the 10 or so books that I looked at (this includes the ARRL handbook and the Art of Electronics). So my question is this:

What are the equivalent circuits for this sort of thing?

Thanks.

Source record: 88806

You can get back issues of QST from the ARRL, and if they don't have it,
they will photocopy the specific article for a reasonable fee.

You can also find this particular article in "W1FB's Design Notebook"
published by the ARRL in 1990. I passed over this book when it was first
published, believing the material to be too simple, but looking over it
a few years ago, I realized it did have some interesting material, and
being written by Doug DeMaw, it was enjoyable in itself.

To make it even more interesting to crystal filter builders, it also
includes a followup article by Wes Hayward "Designing and Building Simple
Crystal Filters" (originally in QST for July 1987), and an article
by Doug DeMaw (originally in QST for January 1990) on building a jig
for evaluating crystals so you can build the filters properly, "A Tester
for Crystal F, Q and R".

It's an auto-transformer. For visualization purposes, select the
tap as circuit common. Then take the part of the coil below the
tap as the transformer primary, and the part above the tap as
the transformer secondary. Then treat it as a normal transformer.
Actual circuit topology may vary from this, but it is a start as a way
to visualize how it works.

You're inducing the field with a current through a part of the coil, and
recovering it through another part of the coil (with one common topology,
through the entire coil). You can use the transformer equations to determine
what the step up (or step down) ratios for voltages, currents, or impedances
will be.

This is available in _W1FB's Design Notebook_. It also contains
_Designing and Building Simple Crystal Filters_ and _A Tester for
Crystal F, Q, and R_. The "tester" was mentioned in W7ZOI's article
but not described so W1FB built one.

The Design Notebook is available from ARRL for $10.

==========
There is an excellent article on a solid state , 'contest proof'
linear amp for 50 MHz , involving a 150 Watts power transistor ,Philips BLX 15.

Power gain : 14 dB ie 6 watts in -----> 150 Watts out at V= 50V-DC
Power consumption (max) 6 Amp.

Reduced power at lower supply voltage.

Price of BLX 15 in the Netherlands : Nfl 115.- (approx US $ 55.-)

Source : 'Electron' ,December '97 ,pages 522-523-524

Hi,

I am looking for plans for a HF Linear Amp using dual 811A's in Parallel. this is a final exam project for Electronic Communications(ETR241) College Course. please help....If you have plans for another type of tube that could be modified for use with the 811A's, this would be good also. I also, could change direction and build an AM reciever using RCA-CA3123E Linear IC or Signetics 546 Linear IC..If someone has plans for that. Please help a desparate College student and future Hammer.
I will gladly pay for mailing cost and printing. Thanks in advance.

Thanks
Mike Porch

Is there any software to replace the TNC, i.e., a setup to hook my rig
to the serial port and use the sound card for packet?

please reply to the list
thx in advance

# 4833. Re: Small Wonder Labs, Green Mountain xcvr

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-27 00:00:00 UTC
From: smurph555@aol.com
Message-ID: <19971127041000.XAA09389@ladder01.news.aol.com>
Source record: 88808

For whatever it's worth, I think the Green Mountain transceiver is probably a pretty good deal. Dave Benson, who founded Small Wonder, is an avid QRPer and he's well respected among the QRP community. It is, however, a board kit, which means you would have to package it. There was a QST review on it, and a number of other QRP rigs a couple of years ago.

For Sale:
I have a large inventory of quality NOS tubes and a wide variety of radio related publications. Also available are radios, test equipment and misc. radio parts. My schematic service is the best price around at just $3 delivered for schematics and tuning info. Quality, tested used tubes are also available. If I don't have it, I'll try to help you find it! Hundreds of happy customers have used my service. Ask Rog42@aol.com for an e-mail copy of my latest offerings - list #1115-T

## 4835. How to Increase bandwidth?

Newsgroup: rec.radio.amateur.homebrew

Source record: 88810

I have a pair of Maxon 49-FX 2-way radios. I tried to use then for remote voice input to my computer. After much experimenting, I have found that the audio bandwidth is too limited.

How do I increase the bandwidth of a factory radio? I have search the web for info on these radios but I have only found bried sales info. I can't even find the manufacturer, none the less a schematic.

If you have a look through the earlier bits of chapter 14 in that ARRL handbook, you should find some comments on computer circuit simulation, particularly with SPICE variants, of oscillator circuits.

You could use SPICE with a deliberate drive signal, to explore the frequency of resonance and find the rough value of gain for oscillation, but you'll likely hit serious difficulties in trying to get the model to exhibit the necessary amplitude controlling behaviour. With very careful hand-feeding of the Spice time increments and the hidden convergence parameters, you can find a little more about the behaviour of a circuit, but in order to do oscillator modelling and get results that are even beginning to be useful, you need either very deep knowledge of the simulator, or else a fairly high-class non-linear simulation package.

Oscillators are the absolute classic objects that exhibit chaotic behaviour from initial conditions, and will test the stability and convergence of any simulator. If you look at the equations that describe the signal in an oscillator that is starting-up, as a series of iterations in time, as a time-based simulator does, you'll see the same structure as was used to make all those infinitely detailed fractal images that became popular some time ago.

With a starting pulse, (or with a declared amount of starting energy in a capacitor) you can make a SPICE oscillator start and run for a number of cycles if you get the loop gain very close to exacly right. I very much wanted to be able to put a simulation example, possibly with the eval version of PSPICE that has become widely circulated, into that chapter, but I couldn't get anything dependable enough not to mislead people.

Many books have treatments on oscillators, but few cover their amplitude!
You could try Clarke & Hess "Communications Circuits: Analysis and Design" Addison-Wesley ISBN 0-201-10040-2

Hi Jim,

I recommend the Siliconix data book for the best specs. The
2N7000 is quite a device. Its an enchancement-mode Mosfet.
It takes 4 to 5 volts posititive on the gate to turn it on. It can be
directly coupled to 5 volt logic. Its equivalent ckt. has a diode
from drain to source. It can carry a husky drain current and can turn
on lamps and relays easily. 73---Joe---W1PNH

>
>What are the equivalent circuits for this sort of thing?

It gets complicated, Luke, because of mutual coupling. At first glance, a tapped inductor looks like it's the equivalent of two or more inductances that are connected in series. However, becaue of the mutual inductance coupling each segment with all of the other segments in varying degrees, it is extremely complicated to draw out an equivalent circuit.

Nonetheless, if you take a simple case of an inductor with a single tap dividing the inductor into sections "1" and "2", then you can draw 4 separated inductors in series and label them as L1, Lm12, L2 and Lm21, where:

L1 is the self inductance of part "1"
L2 is the self inductance of part "2"
Lm12 is the mutual inductance between parts "1" and "2", seen from "1"
Lm21 is the mutual inductance between parts "1" and "2", seen from "2"

In general, L1 is not equal L2 and, likewise, Lm12 is not equal Lm21, but there are some ways of determining roughly the magnitudes of these values.

Another way of getting an understanding of it is to represent the two mutual inductances as if they were the primary and secondary of a transformer. Then the series equivalent circuit would be seen as passing through L1, through the primary of the transformer, then through the secondary of the transformer and finally through the second inductor, L2. Looked at this way, allows you to visualise the effect of mutual inductance in that if the mutual inductance is nil, then the transformer has a minimal effect on total inductance, whereas when the mutual coupling is high, then the transformer can be seen as adding significant inductance in the equivalent circuit.

By the way, this subject is treated extensively in any discussion of transformers, but it is portrayed from a different perspective. There the mutual coupling is everything and the two independant inductances

are referred to as "leakage inductance" since they represent the
portions of the windings that do not couple to one another.

Dave, you are giving the Colpitts and SPICE a bad rap.

The situation is not as bad as you think. Have you looked at

http://www.csolve.net/~add/colpitts/colpitts.htm

The demo for MicroCap V is free, and the link is in the above
URL. The CIR files are in the ZIP archive.

Careful hand-feeding of the time increment is not needed. I set
the time increment to 1/1000 of the main time sweep, and
ignored the hidden convergence parameters.

The useful results obtained are:

1. Neglecting external parasitic capacitance and inductance,
the oscillator ran very close to the target frequency.

If I had entered the inductor and capacitor values more
accurately, the oscillation frequency would have been even
closer. But there is little value in doing so - the
component tolerances would have caused much greater error in
an actual circuit.

2. Using a series base resistor, the oscillator continued to
function over a range of three orders of magnitude in bias
current.

I know of few other circuits that are as robust.

3. The di/dt is very high during clamping at the peak of the
waveform.

This means lead inductance is critical and must be kept to a
minimum.

4. For normal bias, the amplitude of oscillation is
self-limiting.

The base-collector junction forward-biases at the positive
peaks. This draws power from the tank, reducing tank "Q" and
increasing phase noise.

I could have discussed the unusual behavior as the collector
charge is swept out of the base-collector junction, but I
felt that would only confuse the intended reader.

5. With excessive loading, the Colpitts stops oscillating.

SPICE allows finding out how much loading the circuit
tolerates. This is very helpful when designing a circuit,
and tells you how careful you must be when coupling it to
other circuits.

It turns out the parallel-tuned Colpitts is not terribly
critical to any design parameter.

I have been using them in octave-bandwidth UHF VCO's for years
with no problems. These are special start-stop oscillators that
start in one cycle with a initial phase error of less than 10
picoseconds. The error is trimmable to zero. They run with 0.9V
collector-emitter voltage. You can buy the parts anywhere. No,
I can't post the circuits.

This is not true. Please try the CIR files included with the
above URL.

PSpice is not my favorite SPICE software. There are many other
SPICE programs that work better and are easier to use. MicroCap

and IntuSoft, to name two.

# 4844. Help with Identification

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-27 00:00:00 UTC
From: Jeff James <jeffjames@carroll.com>
Message-ID: <EKBDus.2p4@nonexistent.com>
Source record: 88819

Hello all,
I recently acquired a small CW exciter with a single 807 in the final running at very low plate voltage..The tube compliment suggests that it was made in the 40's..The unit has a built in VFO,and was used as an exciter for a home-brew transmitter with a pair of 807's..
The dial reads Electro Mechanical MFG. CO. NY, NY. The model is VX 101 JR..Anyone out there know something about it?

Thankyou,
Jeff James

In practice - less. It is an important advantage for this transistor
compared to many other VMOS transistors, they cause several problems
because they start to draw some current with only .5V gate voltage!
I have used many 2N7006..., they are ufb for dead-bug mounting

I have scratched around the Net, but not come upon a tube listing that contains this tube. Is it rare? What does it cost? Are there direct (or simple mod) substitutes?
This tube is used in a 100w amp I am looking at - need to know if I am getting something that will be more expensive to retube than to buy!
Thanks in advance for info or leads!

Hi,

I am looking for plans for a HF Linear Amp using dual 811A's in
Parallel. Must work form 3 -30 Mhz....This is a final exam project for
Electronic
Communications(ETR241) College Course. please help....If you have plans
for another type of tube that could be modified for use with the 811A's,
this would be good also. I also, could change direction and build an AM
reciever using RCA-CA3123E Linear IC or Signetics 546 Linear IC..If
someone has plans for that. Please help a desparate College student and
future Hammer.
I will gladly pay for mailing cost and printing. Thanks in advance.

Thanks
Mike Porch

John Mock <kd6pag@nospam.mocha.ecofe.com> wrote:

>
>Could you do this with a 40 MHz microprocessor crystal?

The oscillator is a fundamewntal mode circuit. I assume a 40 MHz xtal would be 3rd overtone. I don't know if the technique would work with overtone oscillators.

What about using
>two active devices and a "10.7 MHz" ceramic resonator to increase the
>frequency shift?

This could be a possibility, though I haven't tried it. I did try a circuit with a 3.58 MHz xtal and a 10 MHz xtal but it didn't work. Also using a ceramic resonator and an xtal didn't work. It seems the xtals have to be fairly close in frequency (10 & 18 MHz is OK, but 3 and 17 Mhz might not).

>
>Drawings, please! [Either ASCII graphics or URL, no attachments, please]
>
>

It's so simple I'll describe it. Get a normal NPN transistor (BC548, 2N3904, 2N2222, etc). Wire a 1k resistor from emitter to earth. In parallel with this 1k, wire 120 pF capacitor. Also connect one end of 22pF to emitter. Between emitter and base connect a 470pF. Between base and collector connect 100k. Connect 0.01uF between connector and earth. Wire a 22 ohm resistor to the collector. Connect the other end to +12v power connection. From base to earth wire in an 18.3 MHz xtal. Connect a 100pF variable capacitor to earth. To other side of it wire in a RF choke (10 to 25 uH - need to experiment with this). To the free side of the RF choke and the base, connect a 10.245 Mhz xtal. To get more range wire in an extra 10.245 MHz xtal in parallel.

With a 1uH RF choke and trimmer capacitor (5-50pF) add a parallel tuned circuit to the free end of the 22pF capacitor. Take the 28 MHz output off this tuned circuit. Apply power, tune around 28.5 Mhz and set trimmer to resonate on 28 MHz. A signal whose frequency will be variable will be audible. My unit covers 28.420 - 28.500 MHz in a single tuning range! Freq stability is better than +/- 200Hz in 2 hours.

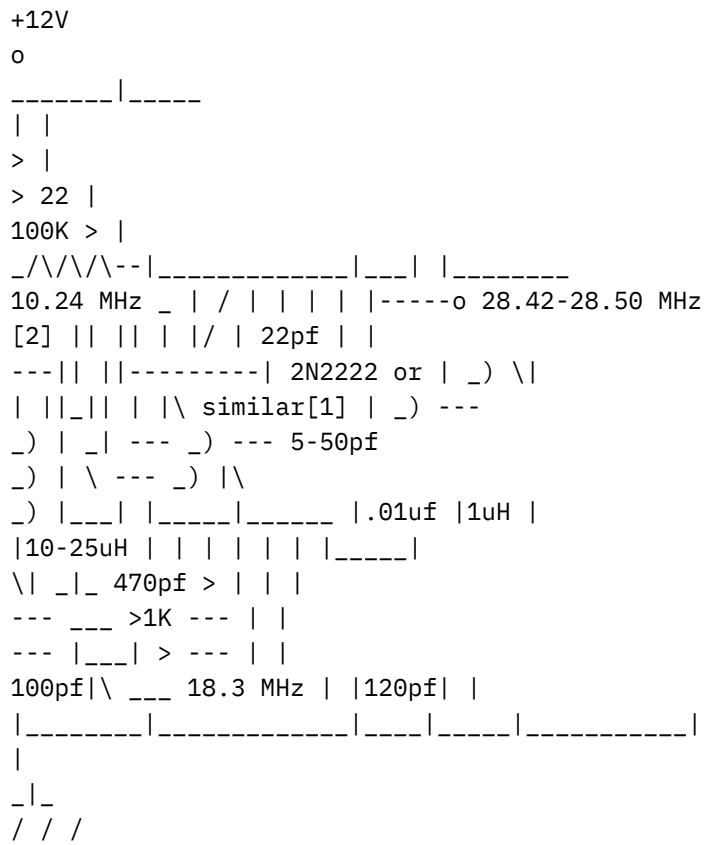
Source record: 88741

Let see, Peter (VK1PK), did i translate your description correctly?



Apply power, tune around 28.5 Mhz and set trimmer to resonate on
28 MHz. A signal whose frequency will be variable will be audible.
My unit covers 28.420 - 28.500 MHz in a single tuning range!
Freq stability is better than +/- 200Hz in 2 hours.

[1] A normal NPN transistor (BC548, 2N3904, 2N2222, etc)
[2] Use two 10.245 MHz crystals in parallel for more range

Now DigiKey and Mouser have HC-49/UA microprocessor crystals for less than
$2 each [and Mouser has no minimum]:

18.432 + 11.0592 = 29.4912 MHz

Derating by .04 as you did above, i presume that the frequency range should
go from 29.370 - 29.450 MHz, covering all of the current passband of RS-12,
and almost half of the passband of RS-15! If you succeed in hearing RS-15,
then a 11.046 MHz crystal should cover most (if not all) of its passband as
well:
Uplink Downlink

RS-12 145.91-145.95 MHz 29.41-29.45 MHz
RS-15 145.858-145.898 MHz 29.354-29.394 MHz

By the way, the entire space sub-band for 2 meters is 145.80-146.00 MHz.

And when correcting for doppler, i would think that +/- 200Hz in 2 hours would be completely inconsequential...

Accordingly to General Electric catalogue dated 5/1946 (yes I know its not the A-model):

6J5
General Description
Principal Application : The type 6J5 is a general purpose triode amplifier designed for service as a detector, amplifier or oscillator tube. Its electtical characteristics are identical to the type Gj5-GT except for lower interelectrode capacitances.

Mounting Position: Any
Direct interelectrode Capacitances
Grid to Plate 3.4 pf
Input 3.4 pf
Output 3.6 pf
pin 1 Shell
Pin 2 Heater
Pin 3 Plate
Pin 5 Grid
Pin 7 Heater
Pin 8 Cathode

Maximum Ratings
Design center Absolut
Plate Voltage 300 330
Grid Bias Never Positive
Plate Dissaipation 2.5 2.75 Watts
Total Cahode curr 20 22 milliAmps
D_C Heater-Cathode voltage 90 100 Volts

Characteristics and typical operation
Heater Voltage 6.3 Volts 6.3 Volt
Plate Voltage 90 250 Volt
Grid Bias 0 -8 Volt
Amplificaion Factor 20 20
Plate resistance 6700 6700 Ohm
Transconductance 3000 2600 Micromhos
Plate Current 10 9.0 Milliamps

Notes:
The d-c resistance in the grid circuit should not exceed 1.0megohm, under maximum rated conditions
Direct connection between heater and cathode is recommended

That isn't a "normal" tube number, and probably why you are having trouble identifying it. Take a closer look and see if you don't find the number 5 to be a letter. Like maybe G.

Sure you dont mean a 6JS6A?? If so, it's a horizontal sweep tube, probably still available from most tube sources.

Hi, I am looking for a schematic for a two tube amp using the 4CX250B tubes. I got a couple of them that are good, but I need a schematic. I know someone in Vegas (Paul, are you listening) has one, but I don't know how to get a hold of him. If anyone can help, please let me know. My E-Mail is da_kang@hotmail.com

thanks

I would like to explore 2m ssb and build my own equipment. I am considering the Tentec 2-10m transverter or the Hamtronics tx and rx transverters. Any experience with either? Any other sources to consider? Also, I would like to build a 2m linear amp, say 1-10 watts in, 50-100 watts out. Hamtronics can get me up to about 40watts. Again, any thoughts?

Thanks,
Wendell Smith

Well, here goes nothing, and why -- OH WHY! -- am I responding to this?!!! :)

The Johnson Oconner Research Foundation (A.K.A. The Human Engineering laboratory) is a company that gives scientific aptitude tests for most of the fortune-500 companies here in the U.S. of A. There are a crap-pile of aptitudes, and one of em' is called "Rhythm Memory." In other words, being able to "keep the beat." I would guess that a ton of folks having problems with the code lack this aptitude. Therefore, I think that using morse code proficiency as qualification for higher licenses is not only antiquated but down right discrimination. This is no dream. Johnson Oconner's research is based on the scientific method and is fact! (A good attorney could have one hell of a class-action suit on his hands here.) Wow. Suing the F.C.C. or whoever. What am I saying!!! :) :) :)

I love the code; however, I hate the fact that it's being used as a "pass-to-the-higher-bands filter." :) :) (I haven't been doing much of it lately -- apartment dwelling sucks!) It's great for DX and QRP work, and is very inexpensive equipment to build, especially when u compare it to the prices of the new DSP front-end rigs :).

Anywho, there's my two-cents worth. Hmmm. I'm sure some will say, "Make that 10-to-the-minus-six-cents worth!" :) :) :).

Donning asbestos underwear!!!! :) (Damn...just got back on the net after 10 years of being off and I'm already getting into trouble :) :).

Randy Jouett (AB5NI).

That's probably a 6JS6A, used in Yaesu FT101B thru EX series
transcievers as the transmitter final amplfier (x2) and other amplifier
applications. Available but becoming increasingly scarce and expensive.
Try Antique Electronc Supply as a source.

You didn't mention equalizing resistors, so I assume you're not using
them -- not a good idea, if that's the case.

Capacitors never have EXACTLY the same internal resistance, so one of
them is going to have more voltage across it than the others and will
be prone to fail.

Message-ID: <65pks4$hhh$1@heliodor.xara.net>
Source record: 88674
Cross-posted to: rec.radio.amateur.homebrew,uk.radio.amateur

I wonder if anyone can help with this:

I have a Nova MR225 PMR rig converted to 2m (not by me). It is a synthesised rig by means of 3 BCD switches addressing an EPROM, and the EPROM outputs control the PLL, marked NJ 8820.

As far as I can see from the nth generation photocopy of the schematic the 8820 has 4 data lines marked D0,D1,D2,D3 and 3 other inputs marked DS0,DS1,DS2.

Trouble is, some of the channels are incorrect, including the packet freq. I need.

Does anyone have a datasheet for this chip? It would help greatly when re-programming the EPROM.

(Keith Kirkwood) wrote:
Instead of coming up with a cock-a-mamy idea like that, which no one
in his right mind would want to get into, why don't you peruse the
dozens of books on PRACTICAL antennas, pick one that meets your
constraints and needs, and try it.

Thousands of people have put millions of hours into sharing their
WORKING experience with their readers. Don't sell it short. As many
errors and myths and as much bad advice creeps into publications, they
are still 1000% better that a totally uniformed approach.

Specifics:
Long wires do not get bundled, looped around in attics or
'Multi-banded. They run straight out into fields at lengths of over
1/2 wavelength at the lowest frequency, and they have tuners to tune
them and very good ground systems.

Your questions on the type of coax to be used suggest that you don't
understand long wire antennas at all. Long wire antennas do not
attach to the end of coax - they attach to the long wire terminal on a
tuner. If you insist on using the coax and the attic, start thinking
in terms of a tuner, a balanced antenna in the attic, a balun for
connecting the coax to the antenna. Then, after you've got that out
of your system, buy some ladder line to feed it an throw the balun and
the coax back into the parts box.

I'm sure it could be done, but I'm not sure why you'd want to do it.
There are better approaches one could use than a regen design
once you admit the possibility of using more complex devices.
Today an active device costs millicents when encapsulated in
an IC, and an IC encapsulates thousands of them, so you might
as well make use of all that stable gain instead of fooling with
regeneration to push a single device to the edge of stability.

There might be a niche for using such a scheme as a modern
Q multiplier instead of using an off the shelf filter. But I don't
see the regenerative detector per se as bringing anything useful
to the table today.

In my circuit, the inductances that I was trying to account for are adding up as L1 + L2 + LM12 +LM21 to give the total inductance across the entire coil. (This assumes that the two halves of the coil are

Ok. Second try:

Could I measure Lm12 by driving driving section 1 of the coil with a signal, and measuring the output on the second section, relative to, say, the tap? And then measure Lm21 interchaning the driven and measured points?

I have to agree with Gary's post about looking at the tapped inductor
as an autotransformer. However, I'm not sure that will take you where you want to go.

This might be interesting to look at. But what if I have a transformer with a tapped winding?

That is, a 2:1 turns ratio produces a 4:1 impedance transformation. If that's all you're interested in, you can neglect things like

This should really help me in understading what's going on.

leakage reactance, winding resistance, etc. So, it's a question of what your real curiosities and concerns are.

Well, I've seen most tapped inductors in impedance-matching situation -- antenan tuners, input circuits, and so on -- so your help has been most invaluable.

Here is the only reference that I can recommend without going to a good library:

[list snipped]
Thanks. I'll see what the library has.

d) ARRL The Radio Amateur's Handbook, 36th Edition, 1959

I have the '97 Handbook; while there is a huge section on inductors, as well as conventional transformers, their treatment of autotransformers is limited to less than a page, and they don't mention tapped inductors anywhere else in the book.. I'm going to look up some of the other books that you mentioned.

Thanks a lot.

I have a 97 Mercury Sable and I am looking to install my Alinco DR600 2m/440m mobile rig in it. I am trying to find some other hams who may have installed gear in this vehicle (or a 97 Ford Tarus). Any information on successfuly setups would be helpful. Also information about what kind of antenna setup you have would help as well. I'm looking to do either a trunk mount or glass mount. Not sure which will be the best route. My mobile rig has a remote kit which I am considering as well. I've found that there is not much room for a radio in this car. Well, any help, advice, or comments would be appreciated. Thanks.

Source record: 88762

This is not the answer you want to here but:
I would use a tracking generator to tune any filters
to a needed bandpass .
I do not think I live close enough to show you how my HP8920 works.

It may be possible to inject a small rf signal into input and
measure level at output.
If you do this over a range of many frequencies you can
plot the filter response on a chart.
Everytime you make a Adjustment you should measure
the same frequencies all over to develope new chart.
LABOR INTENSIVE but a idea.
If you are asking about impedance matching and how to
design correct values then I will not attempt to go any farther.
I can tell you that if you are tring to take a Heilical filter
designed to work at a much higher frequency than desired,
rods may be Too Short to make any adjustments that are useful.

>So Lm12 is k*sqrt(L1*L2), right? Where k is the coupling coefficient.

Well, yes and no. The circuit that I tried to draw with words wouldn't be the correct equivalent circuit to be looking at when you use your formula. The formula k = M/( sqrt (L1 * L2) is the general formula for defining coefficient of coupling. It basically says that a coefficient of coupling of unity occurs when the Mutual Inductance is the geometric mean of the two inductances that are coupled.

In my circuit, the inductances that I was trying to account for are adding up as L1 + L2 + LM12 +LM21 to give the total inductance across the entire coil. (This assumes that the two halves of the coil are wound additively. If they are wound subtractively, the two mutual inductance terms would subtract and you could theoretically wind up with zero inductance).

I have to agree with Gary's post about looking at the tapped inductor as an autotransformer. However, I'm not sure that will take you where you want to go.

In order to take a simplistic approach, one would have to know the application. Since you are concerned primarily with RF circuits, you should be able to neglect losses (if the inductors have air cores), and you can assume high (0.6 - 0.7) coefficient of coupling. In order to get higher coefficients of coupling and also have low losses, you must have high quality ferrite cores. If that be the case, then the impedance transformation ratios are closely related to the square of the turns ratio - regardless of whether you are accomplishing this with an autotransformer or an equivalent conventional transformer. That is, a 2:1 turns ratio produces a 4:1 impedance transformation. If that's all you're interested in, you can neglect things like excitation current due to core losses, coefficient of coupling, leakage reactance, winding resistance, etc. So, it's a question of what your real curiosities and concerns are.

>Can you recommend a textbook?

Here is the only reference that I can recommend without going to a good library:

a) ITT Reference Data for Engineers, 4th Ed..
p140 - Power transfer between to meshes coupled reactively
p141 - Definition of coefficient of coupling
p145 - Matrix for Inductively coupled circuits.

pp237, 238 - Coupled circuits for bandpass design.
p273 - Good, generalized equivalent circuit of a transformer.
pp287-289 - Design of audio-frequency transformers - including
equivalent networks that illustrate which parameters are important in
determining frequency response for low, mid and high frequencies.

a) Electrical Engineering, Theory and Practice, by Erickson and
Bryant, Cornell University - John Wiley & Sons
pp 92-93 Effects of mutual inductance.

c) Physics, by Hausmann & Slack - D. VanNostrand & Co.
pp693-697 - Mutual Induction.

d) ARRL The Radio Amateur's Handbook, 36th Edition, 1959
pp26-27 Calculating Inductance (based on physical parameters)
pp29-30 Mutual Inductance

I hope you can find some of these references. I'm afraid my personal
library is somewhat dated.

I always look in Terman, "Electronic and Radio Engineering", 1943. Terman
wrote several but the 1943 is pretty inclusive of all that pertains to
inductivly coupled circuits.

# 4905. Homebrew Multiband Longwire?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-29 00:00:00 UTC
From: krkirkwood@sprintmail.nospam.com
Message-ID: <MPG.ee9f76eb2c7a7ee989684@nntp.a001.sprintmail.com>
Source record: 88769

Could someone please give me some feedback on this idea. Being relatively inexperienced in antenna design, I'm not sure that this idea is valid.
I want to create a "multiband" longwire antenna, tuned to each of the shortwave bands. I plan to do this by creating a longwire cut for each band, and then bundling them together, in essence, creating just one long wire antenna. My question is: will this actually give improved performance on each of the bands, or will they "combine" to give me some improvement on one band, but not the rest.
My plan is to hang this in my attic (gotta love homeowners associations...) and utilize some 18 gauge, 4 conductor shielded wire that runs from my attic down to my basement where the receiver is. Is this wire a suitable substitute for something like RG-6? Or would I be better off using the CATV coax than runs from attic to basement?

Thanks, -K2

It's not quite that simple, but you're on the right track.

I will make the following assumptions in order to get more specific:

-- L1 and L2 are unknown inductances, which are connected in series with one another and have some unknown mutual inductance - i.e., there is a magnetic coupling between the two coils of some unknown amount.

-- The coils are air core coils.

-- The frequency of operation is such that all stray or parasitic capacitances are at least small, if not negligible.

-- The size of wire used is such as to make the resistive losses negligible (Hi Q coils).

I will try to give you practical procedures for measuring the important parameters of the circuit, but be advised that your measurement devices may not be adequate to the task - especially for frequencies above 10 MHz. When making measurements at audio frequencies, one can usually find simple, inexpensive test equipment that is more than adequate, but the higher you go in frequency the more sophisticated is the necessary equipment.

Ideally, an impedance bridge would be used for the measurements. However, the use of an oscilloscope and judiciously chosen current sampling resistors could also be used.

Define the circuit connectivity as follows:
-- Inductance L1 connects from Terminal 1 to Terminal 2.
-- Terminal 2 is circuit common.
-- Inductance L2 connects from Terminal 2 to Terminal 3.

Two impedance measurements can be made across Terminals 1 and 2, as follows:
Measure Z1sc with Terminal 3 shorted to terminal 2.
Measure Z1oc with Terminal 3 open.

Likewise, two impedance measurements can be made across Terminals 3 and 2, as follows:
Measure Z2sc with Terminal 1 shorted to terminal 2.

Measure Z2oc with Terminal 1 open.

The laws of lumped, linear, passive circuits allows us to characterize the circuit by means of the above measurements. ( There are more sophisticated characterizations of the circuit into its equivalent T or Pi section using matrix theory.) However, for our immediate interests, it should be seen that the inductances of the two coils, L1 and L2 are measured as Z1sc and Z2sc respectively. Likewise, the inductances (L1 + L12) are measured as Z1oc, while the inductances (L2+L21) are measured as Z2oc. From these measurements the isolation of L12 should be Z1oc - Z1sc and the isolation of L21 should be Z2oc - Z2sc.

Obviously, if the two coils are identical, then the two inductances should be equal and the two mutual inductances should be equal.

I don't know if this will help, because it all seems so abstract. In my opinion, the impedance transformation that is brought about through transformer action is all that matters (at least in the case of ideal transformers) and the issue of mutual inductances and how to measure them seems relatively unimportant. When the coupling becomes low and the "leakage" reactances become significant, that's when you need to become concerned, because those effects will cause you to see undesirable phase shifts and mismatches. Similar, but different effects, would be caused by losses in magnetic core materials, but we are not considering anything other than air core transformers in this discussion.

Hello Wendell,

I have the TenTec 6m-2m transverter and it works fine. Another good source is Down East Microwave in NJ. They carry a complete line of transverters and just about everything else for VHF-UHF. They carry the Teletec line of solid-state amps. I use the 2m and 70cm versions and they are very clean as far as intermod distortion. The 2m amp will produce about 175W out with around 40-50W of drive. Good luck and hope to hear you on next sporadic E or Meteor scatter opening.

In the October, 1970 issue of QST, there is an article titled "The Junker Amplifier" by Lew McCoy, W1ICP. This amp could be configured to use an 813, 803 or a pair of 811As. Lots of good ideas and about as simple as you can get. Haven't built one, but all the McCoy ideas I've tried have worked out very well.

The applicable regulations are in the Code of Federal Regulations, Title 47 (Telecommunications), Chapter 1 (FCC), Part 15 (Radio Frequency Devices). A starting point to access the government printing office on-line database for Title 47 is:

http://www.access.gpo.gov/cgi-bin/cfrassemble.cgi?title=199647

Section 15.239 (reproduced below) covers unlicensed intentional emitters operating in the FM broadcast band. Although the rules are stated in terms of field strength at a given distance, you can work backwards to find out what kind of transmitter power might be legal. Assuming an isotropic (zero dB gain) antenna with no transmission-line losses, the power which will produce a field strength of 250 uV/meter at 3 meters is only 0.019 microwatts. At that radiated power level, with a good receiver, you are lucky to get a reliable range of 100 to 200 feet. There are a lot of FM transmitter kits out there that will exceed that range with a good antenna, but they are *not* legal!!

On the other hand, you can build your own transmitter for the AM broadcast band, where the Part 15 rules allow 100 milliwatts and an antenna length of 3 meters. A local range of a mile or more is possible with AM modulation; experimental "MedFER" CW beacons can sometimes be heard at distances greater than 1000 miles.

Regards,

Lyle, K0LR

----- Excerpt from Part 15 rules ------

Sec. 15.239 Operation in the band 88-108 MHz.

(a) Emissions from the intentional radiator shall be confined within a band 200 kHz wide centered on the operating frequency. The 200 kHz band shall lie wholly within the frequency range of 88-108 MHz.
(b) The field strength of any emissions within the permitted 200 kHz band shall not exceed 250 microvolts/meter at 3 meters. The emission limit in this paragraph is based on measurement instrumentation employing an average detector. The provisions in Sec. 15.35 for limiting peak emissions apply.
(c) The field strength of any emissions radiated on any frequency outside of the specified 200 kHz band shall not exceed the general radiated emission limits in Sec. 15.209.
(d) A custom built telemetry intentional radiator operating in the frequency band 88-108 MHz and used for experimentation by an educational institute need not be certified provided the device complies with the standards in this part and the educational institution notifies the Engineer in Charge of the local FCC office, in writing, in advance of operation, providing the following information:
(1) The dates and places where the device will be operated;
(2) The purpose for which the device will be used;
(3) A description of the device, including the operating frequency, RF power output, and antenna; and,
(4) A statement that the device complies with the technical provisions of this part.

## 4918. Butler Oscillator with FET

# 4919. Ferrite Rod LOOPSTICK RX Ant at HF

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-11-30 00:00:00 UTC
From: "P. Singh" <singhpk@AT.exit109.AT.com>
Message-ID: <3481B174.5950@AT.exit109.AT.com>
Source record: 88705

Hello guys,

Does any one have some experience with ferrite ROD LOOPSTICK
antenna at HF frequencies in the range of 3.5 MHZ to 10MHZ.

It seems that they can works well enough if the following
conditions are satisfied:-

1. The ROD is of sufficiently high quality at the frequency involved
One out of three old Ferrite Rods worked well.
2. The rod is about 7-8 inches long
3. A J-FET is used as source follower to match the impedance to the
input of the radio.

I think that some people have done some work on this , I think in
elektor magazine in 1980's or so. If some one knows more about
this topic please let me know.

Hi Fred,

That resistor sounds like a Clarostat number. Another source for
wirewound enamel resistors is Ohmite.

I have a couple of PTS160 MHz synthesizers asking $450 shipped US48.

Specs

Frequency Range: .1000000MHz to 159.9999999 MHz
Frequency Resolution 1Hz
Control local by 10 position dial, TTL BCD or GPIB
Switching time 20 microseconds to 5 microseconds
Output level +3 to +13 dBm
Flatness +/- 0.5dB
Impedance 50 Ohms
Spurious Outputs -75 dBc
Harmonics -40 dBc
Broad Phase Noise -63 dBc (.5 to 15 KHz)
(1 Hz) -105 dBc @ 100Hz, -115 dBc @ 1KHz
Frequency Std. TCXO
External drive 5 or 10 MHz
Dimensions 19 x 5.25 x 18 inches
Weight 35 lbs

Check the pictures and specs at my page:

Are you're into homebrew electronics, or need a replacement chip for
a piece of hardware that you'd like to repair?

As part of my fall/winter cleaning, I am clearing out my collection
of electronic parts and supplies.

Most of these chips are early-mid 1980's vintage, which is when
I was involved in hardware design work, so if you're looking for
AMD K6's or Intel Pentium II's, you won't find them here.

All the chips were functional when I stored them away a number of
years ago, and they are all packaged in anti-static foam or tubes.
Unfortunately, I don't have any means of testing these chips,
but if you buy one and it is DOA, you may return it within 10 days
for a refund.

I have not priced any of these chips, so all reasonable offers will
be considered. All chips are packaged as DIP's unless otherwise
specified. Numbers is parentheses are quantity of chips available.
Sorry, I don't have datasheets for any of these. Buyer to pay shipping
costs.

I also have hundreds of TTL chips and assorted other goodies too
numerous to inventory right now. Please e-mail me with your requirements
and I will tell you what I have available.

Thanks for looking!

Howdy,

I have built a DDS circuit that I used as the back bone of a simple trnasceiver. It was a direct conversion scheme, and was CW only. It operated on 80, 40, 30 , and 20 meters. I was not overely impressed with Receiver circuit, so for my senior design project in EE here at Montana State Univ, I am build ing a 20 meter superheterodyned receiver, the L.O. still uses essentially the same DDS oscillator I used in my previous projects. I have been very pleased with simplicity of using the AD7008JP50 along with the 87C51 microcontroller. I had a 4 button keypad as my control panel, my new design will incorporate a 16 button keypad, a Grey Code tuning shaft, and will be tuneable via a serial connection to any terminal. The possibilities with an oscillator that tunes from 0 to 25MHz in 1 Hz step is endless. I have been fascinated with DDS technology for the last 3 years, and I keep getting more and more ideas for projects. What I suggest when using a DDS chip though, for example the AD7008JP50, is to use it well below the Nyquist rate. At 25MHz, the signal is a triangle wave, down at 5 MHz though, is is a beautiful sine wave.

I recapped the voltage doubler in a Collins 30L1 amp using them a few
years ago and it held. They are just smaller, apparently no more
fragile.

According to my RSGB VHF/UHF Manual, it appears a FET may be used directly in place of the bipolar oscillator transistor and the second stage must be a FET. This is on page 4.14 in the fourth edition book (1983). Hope this helps.

Hello,

I just picked up at a German Hamfest this weekend a Spectrum
set made of a Mainframe 7603, a Spectrum Plugin 7L12 and a
tracking Generator TR502.
What I would like to know is how to connect the Tracking to
the Spectrum :-) Is connecting the 2 LOs enough or do I need
to connect something else ?
Also, I am looking for the Manuals for all this equipment's.
I will pay what ever and return the original via FedEx or DHL.

If you can help, please reply directly via eMail.

73 Qro, Daniel.

That's all, it's just a couple of 50 ohm SMC terminated coax jumper leads. And I guess you know that you will need a TM502 to power the TR502, or a wider one such as TM503,4,etc if you also want to link in a counter and possible prescaler.

There may also be a provision for a control lead between the analyser and the tracking generator with LEMO connectors. This allows a bright spot to be put on the screen at a point where the sweep is paused to gate a counter, such as a DC509, through the TM backplane, but this lead is not a requirement to get the generator to track.

Regards,

There are 23JS6 and 31JS6 versions, too-- there were designed for
controlled-current heater strings. In a pinch, you could use these
versions (Which oughta cost less) and an external filament transformer
or two (series-connected as appropriate).

I own recently a Tech Trodiper grid dipper.
The thing works ok, the problem is that I have only 1 coil.
(40-140 MHz).
I want to create the other ones myself. The coil exists of 2 components:
one resistor and the coil.
I want to know what the values are/must be for the other coils...
Who can provide me with that data?

<snip>

Hello--

At your public library, look for an early edition of a book entitled, "The Amateur Scientist", by C. L. Stong: this book consists of reprints from older Scientific American magazines (1950s vintage?) and includes plans for an X-ray machine using a vibrator-type Ford spark coil for high-voltage AC and an old UX-201A tube as the X-ray gennie.

Some older tubes of the 201's vintage used a magnesium getter flash coating on the inside of the tubes' envelopes that produces soft X-rays when bombarded by electrons. You tie all the pins together and use an external foil electrode wrapped around a portion of the tube's envelope, and then hook the commoned pins and the foil to opposite sides of the spark coil. The HV AC does the rest. Standard cautions and disclaimers apply-- don't X-ray your children, camera or small domestic animals.

I'm working from memory on this one, so if anyone else out there recalls more details, please pass 'em along.

>These would be somehow related to the y-parameters, no?

My mind does a blank on y-parameters - are you talking about
admittance equivalents instead of impedance equivalents?

My ref. to lumped, linear, bi-directional whatever is just to get the
standard disclaimer into the picture, so as to avoid the difficulties
attendant with non-linear or distributed circuits containing such
intractable items as transmission lines and diodes. Hi.

BTW, this conversation is beginning to strain my feeble brain that
hasn't done any serious thinking in these thingss since college, circa
1948-53.

But it's interesting and stimulating, nonetheless.

Electrolytics have been made smaller over the years by techniques to increase the surface area of the aluminum plates. Instead of smooth metal, the surface is very rough on a microscopic scale, greatly increasing the surface area and hence the capacitance.

Hi,

I have a large variable condenser(old talk for capacitor), that I cant identify. The plate thickness changes from thick on one side to thin on the opposite. The rotor is an inverse image of the stator so that it will mesh. The spacing of the plates get closer together as the plates are meshing. Appears to have a higher breakdown as the capacitance decreases. Anyone seen this before? You gotta have been around to figure this one out. Probably made before WW2.

Those RF lamps really burn me up. Several of them in my neighborhood produce low and high level QRM on broadcast, 160 and on 10 meters.

The only thing worse is a touch lamp. So, yes, these lamps do produce RFI.

Motorola 2N6083 and 2N6084 have 19dB gain in 6m linear amplifiers,
they may work just as easy for class C. You don't need to buy all
those high cap trimmers, use an amount of 100pF capacitors and try to
increase the number or opposite (100pF steps works fine).
Several friends has used similar design:
LA8OJ built two 2N6083 amplifier
LA8AK built one 2N6083 amplifier
SM6HYG built one 2N6084 amplifier

Since drive level from PW Meon transverter is 23dBm (0.2W), the output
is close to 43dBm (20W).

Somewhere, I have a copy of the book you are referring to. The fellow who wrote the xray article started with one of the old time tubes, but progressed to having a local glassblower fabricate tubes of his own design for him.

The power supply was an Oudin coil--similar in basic nature to a Tesla coil, except that it is an autotransformer. His deluxe xray machine featured all sorts of lead shielding and a lead colimator. He produced some interesting photos of the bones in a frozen fish, and nails and screws driven into a block of wood.

BTW: That book is an AMAZING tribute to the ingenuity of garage-class tinkerers. It also includes plans for a linear accelerator (atom smasher!) and simple magnetic resonance electronics. No mad scientist should be without a copy of this book.

Can someone help me with a CTCSS tone circuit? I know I can
get a kit for $25, but I only need one tone, and I'd rather build it
myself for a couple $. Can a 555 timer be used for this? Please
email me if you can help. Thanks a lot.

Hi to all

At last ham fest I've foud these filetrs:

Plessey H-32-1870-L marked 1.0 MHz USB FILTER
Marconi H-32-1872-01
Marconi H-3218723-01
They are all mounted on the same board marked H-32-1895
Date around 1965

Any idea of the radio they were in and the specs ?

Thanks in advance and 73

P: I think Doug DeMaw did an article on just this subject for CQ
magazine during the last few years. I will see if I can dig it up
for you. As I recall the article contained info on how to salvage the
rods from cheap little broadcast band radios.

They are probably 6JS6A tubes.

Hi,

6JS6A's were originally TV horizontal sweep tubes and were pushed into service as medium power linear amplifiers a number of years ago. There is a later version, the 6JS6C which I imagine is a drop-in replacement.

Cheers - Joe, G3LLV

According to my RSGB VHF/UHF Manual, it appears a FET may be used directly in place of the bipolar oscillator transistor and the second stage must be a FET. This is on page 4.14 in the fourth edition book (1983). Hope this helps.

Source record: 88640

Howdy,

I am currently using an MFJ-1788, the 40 to 15 meter version. I am not overly impressed with its performance, but ate the same time I can't complain. The tuning unit is wonderful. My problem is I live in a apt. complex, that will not allow any type of antenna sticking out the windows or anything. So I use my MFJ loop by setting it up in the vertical position on a kitchen chair. I have found that if I place the chair smack in the midddle of my living room and rotate the antenna so that the null spot is towards my radio, I can usually tune it to about 1.5 : 1 or so. I run about 10 to 75 watts, depending on which neighbors are home. I have made some successfull QSOs with it, I get real good luck on 20 meters, but 40 and 30 take a bit of patience.

Anyhow, hope this helped. Good luck es 73s.

de aa7yq,
Kevin Ames

I am not familiar with the term "IIRC" nor with the works of Sedra & Smith. Perhaps this would be an appropriate place, however, for a reference to the works of Philip Geffe, with whom I am more conversant. His book "Simplified Modern Filter Design" (John F. Rider, Publisher) has some relevant material on pp 30-35. He discusses tapped coils in his discussion of bandpass filter design. Of course, his entire approach is slanted to the design of filters and not the subject of tapped inductors. However, his approach sheds some interesting light on our discussion in the area of network equivalences. If you have problems finding a copy of that reference, I could copy the few pages involved and mail them to you, if you feel that they would be of great value.

In particular, I find his "T" and "PI" equivalent circuits of an ideal transformer of turns ration 1:N to be very interesting, useful, and easy to understand for someone not familiar with the practical circuitry. I would like to be able to convert the equiv. circuits and expressions into e-mail, but my abilities fail me.

I like the fact that his equivalent circuits are so easily checked for N= 1 and for N>>1. For N=1, the circuits are trivial. For N>>1, the transformer simply transforms the impedances according to N^2 as you uld expect. I like it when theory matches what you've always depended upon as truth.

I wish I had a page scanner, because the procedures for sending TIF and GIF files by e-mail seem to be working OK for files under a megabyte.

By the way, Geffe's book has a great, 17 p chapter on inductor design (but all of his data and examples are in the audio spectrum), and he also has an interesting 10 p chapter on measurement techniques (for filters) - so, it would be a good book to have if you're really into practical filter design.

>As one of my profs says: the purpose of a lecture isn't to impart the
>material to students, but rather as a way of the prof organizing his
>thoughts. I find this to be true: as a teaching assistant for a

>useful.

I think your professor must have had "tongue in cheek", as we say.
When I taught EE at the US Naval Academy, I would never have
approached a lesson in that way. I always enjoyed teaching far more
than anything else that I've ever done, because it's the best way to
learn a subject and also because of the instant gratification in
seeing the students comprehend a concept for the first time.

I had a chance to try 10 meter cw during the CQWW contest and noticed something strange. While tuning up, my swr slowly crept up from 1:1 TO 2:1 -- then started coming back down. I thought it was the antenna or feedline, but saw the same thing on a dummy load. The only thing remaining in the short feedline was an Oak Bay Technologies LP-11p Low pass filter which I noticed was getting warm. The filter is rated at 1KW and I'm running about 500 watts. The filter is assembled with many rivets and not easily opened. The rig is an TS-830 /Ameritron AL80B. The filter is as cold as stone on all other bands. If any of you fellows have an idea what's going on, I'd sure like to hear from you.

Great stuff!

The fellow who
>wrote the xray article started with one of the old time tubes, but progressed
>to having a local glassblower fabricate tubes of his own design for him.
>The power supply was an Oudin coil--similar in basic nature to a Tesla coil,

I have been using EHT rectifiers and beam triodes connected back to front
driven by an flyback tfmr + tripler. Drives a geiger counter mad two or
three metres away - I haven't tried exposing film yet, thats next on the
agenda. Not all the tubes can handle the EHT though, some are gassy and
break down internally, others only produce low x-ray flux.

This is *the* basic and intermediate electronics textbook here at UofT. Of all the textbooks I've looked at, I like this one the best. While the book doesn't have quite as many applied examples as, say, Art of Electronics, the explanation of the theory is unsurpassed.

approached a lesson in that way. I always enjoyed teaching far more than anything else that I've ever done, because it's the best way to learn a subject and also because of the instant gratification in

Perhaps this is what he meant -- I guess approaching a lecture disorganized and unprepared is not a good thing, especially for the students, but the act of preparing for the lecture -- creating course notes, problem sets, and such -- appears to be a great technique for organizing one's thoughts. And who knows -- maybe looking at the basic equations and concepts can stimulate the brain in a new way, and one can approach an advanced problem from a new direction.

But this is straying far from the original discussion. Thanks for the help you've given me on the inductor front, Robert. I'll have a look at some of the books that you've recommeded after exams.

It's rather simple. The basic cable should be:

```
APPLE 15p sub-D VGA 15p HD-subD
red gnd 1 6
red video 2 1
green video 5 2
green gnd 6 7
blue video 9 3
sync gnd 11 4
V sync 12 14
blue gnd 13 8
sync gnd 14 10
H sync 15 13

SENSE
sense 0 4 4 (sync gnd)
sense 1 7 4 (sync gnd)
sense 2 10 4 (sync gnd)

The more difficult part are the sense pins that are used to select the
resolution and mode.
E.g.
640 x 480 VGA connect pin 7-10, don't ground the sense pins at all
1152 x 870 all sense pins grounded

In general with multiscan codes pin 4 is always grounded. 7 and 10 are
connected with a wire or a diode.
Wire: 'code 3' (multi 13")
Diode: K-7 and A-10 'code 35' (multi 21")
Diode: A-10 and K-7 'code 11' (multi 17")

Am rebuilding an ATV repeater and need to replace the 45 MHz
IF/video/audio module. Have module from VCR: Model NEC N915U.
PCB is: Tuner/IF NHE-86 72378782 PWV-878
Can anyone email a schematic of this module? Looks like exactly what I
need to use, but have no documentation.
Thanks, Woody

How badly do you want a 9 MHz IF? It's easy to find large quantities - cheap - of crystals at surplus places. Even if a bag of (say...) 200 3.6864 MHz crystals only produces a handful worth making a filter out of, for 5 bucks, who cares?

You'll know you're really into this when you start lusting after sweep generators. :-)

This if a fun one HA!

I would call Oak Bay!

If it is out of waranty and you want better understanding here is a idea!

Drill out the rivots and find a can of freeze mist/ cooling spray.
You have a component that is changing it's value as it increases in heat.
Yes! it only heats up on the highest frequency used, 10 meters.
Reactance is a hard thing to understand at times.
I wonder if a Capacitor is a gremlin here.
Hey! Make sure you remove this filter and run same test with it removed
first.
The Amp or rig can do the same dance.
Interested in your findings?

Doug: Don't do it OM! If you're going to Homebrew, homebrew the filter too! I found that this was one of the most fun parts of my recent receiver project. I too was briefly tempted by a commecially made filter, but I'm glad I rolled my own. Learned a lot too.

I simplified the process described in the W7ZOI and W1FB articles by not getting too hung up on determining the precise electrical characteristics of my crystals. I just decided that my color burst crystals were pretty much similar to those used by DeMaw. I was careful to make sure that all the rocks in the filter were very close in frequency. It all worked out well.

One other option: Order the rocks from JAN crystal, and ask them to provide the data you need to do the calculations described in the HB crystal articles.

Good luck, 73, Bill N2CQR

>Any info would be appreciated...especially regarding the pinout to acc1

Hello Steve,

I have the TS-450 rather than the TS-940, but I would be very
surprised if there were any differences in the 6 pin connector ACC-1.

In fact, the User's Data for the IF-232C, itself, says that it is
designed for transceivers capable of computer control, such as the
TS-940S and the TS-811/711 series.

I have used the Kenwood IF-232C External Control Interface with it,
and it works fine.

Here's the pinout per my data sheets:

1 Signal Ground
2 Transmit Data (Output) (TXD)
3 Receive Data (Input) (RXD)
4 Transmit Enable (Input) (CTS)
5 Receive enable (Output) (RTS)
6 N/C
Note that the meaning of "Transmit" and "Output" refer to signals from
the transceiver to the PC.

The data sheet also indicates that whereas the PC's serial port is
RS-232C (-12v to + 12v), the Transceiver uses TTL (0 to +5). I guess
that explains why it is you can't just connect the two ports directly
together - Hi.

One other point of interest. As is the case with almost all RS-232
devices, remember that the connection between the Transceiver and the
PC MUST connect Transmit Data to Receive Data and vice versa.
Likewise the CTS/RTS lines are also cross connected. Well, that's
consistent, isn't it?

Don't forget which pins are which on the PC side. Depending on whether
you have a 9 pin or 25 pin connector, as follows:

Signal 9pin 25pin

TXD 3 2
RXD 2 3
CTS 8 5
RTS 7 4

GND 5 7

I should point out that the IF-232C unit uses a 4 circuit Opto-isolator chip, a power regulator chip, and two chips for line driver/conversion functions. It does a great job with a cable length of 100 feet, so I'm satisfied that it is noise free. I can't remember for sure what software I used but there were two shareware programs that work fine, and I got them from the QRZ CD-ROM.

I couldn't find any reference to such a controller in my 1994 ARRL Handbook, so I can't comment on that.

If there's anything else you need, don't be bashful.

Not that I know of, most of the manufacturers (Radio not filter) don't want you to know how really poor they are. Hi-ripple in the passband, high insertion loss, and really lousy intermod characteristics. Ultimate rejection poor to fair.

I am looking for ones that are usable for 9mhz IF
>for homebrewing.

You can build one far better than you can purchase...at any price.

I suspect that most (like Yaesu, Kenwood) are other

From: Mike <bad@email.adr>
Message-ID: <34852F38.1273@email.adr>
Source record: 88666

Hi Gang,

A short while ago there was a thread on grinding your own crystals. It appears to have expired off my newsserver, but I just stumbled across an excellent site on frequency standards, crystal processing, and the history of FT-243 and FT-241 crystals during WW2.

The main site is:

http://bul.eecs.umich.edu/uffc/uffc_fc.html

A wonderful page on crystal manufacturing and the problems caused by lapping and polishing is at:

http://bul.eecs.umich.edu/uffc/fc_history/bottom.html

There is a lot of information in this article (50 years old!) Some references were made in various postings that touched on some of it, but you might find it interesting reading if you plan to do it yourself.

My local library has 1 copy. It's old and falling apart. It's also out of print.
Who has a scanner?

I remember many years ago seeing a design for a DIY dye laser in the
mag. It was *very* dangerous in terms of the power output, and I think
that the dye used was carcinogenic.

>email me if you can help. Thanks a lot.

The frequency tolerance for CTCSS is very tight. I very much doubt
that you can get a free running 555 to stay on frequency closely
enough to work for long. There are purpose built chips for CTCSS,
which is clearly the best way to go, but you could use a chain of
divider chips from a stable reference (crystal or ceramic resonator)
to generate the tone frequency. Clean up the divider output with an
opamp and RC filter to turn it back into a sinewave. Or you could locate
one of the old vibrating reed encoders and adapt that to your project.
That should be virtually free.

Well, you could look at quality analog sinewave oscillators. They
typically use an auto-adjusting (e.g., a light bulb filament) negative
feedback path to balance a positive feedback path, to keep a stable
oscillation level which doesn't drive the active devices to clipping.
Careful construction and adjustment can get you to a few ppm distortion
levels...maybe lower if you really work at it.

>

C.L. Stong's "The Scientific American Book of Projects for the Amateur Scientist" is a compilation of articles that appeared in the "Amateur Scientist" column in Scientific American between the early 50's and the mid 70's when Stong passed away. The present day "Amateur Scientist" column is but a shadow of it's old self under Stong (in today's world, the magazine's lawyers would probably have a fit if it were to publish such articles). An index of these articles can be found at:
http://web2.thesphere.com/SAS/SciAm/Index/52-index.html
According to the index, an X-ray machine was published in July 1956.

A university or a big city public library should have bound issues of Scientific American in the stacks. My favorite article was the Helium-Neon laser published in September 1964, only four years after the first lasers were made in research labs. I used to drool over such articles along with a few nerd buddies in high school, but the high vacuum and glass blowing techniques were a bit beyond our technical means at the time (this was long before you could buy a He-Ne laser tube for $20 at any hamfest). You'll also want to look up the proton accelerator (August 1971, handles deuterons also but watch out for those stray neutrons that break loose!), electron microscopes (September 1973), mass spectrometer

(July 1970), and CO2 laser (September 1971). Many of the laser articles were reprinted in the book "Light and its Uses" from Scientific American.

A more modern resource for the mad scientist is a publication called "The Bell Jar", see http://www.tiac.net/users/shansen/belljar/index.htm

Their web site has an article about X-ray machines at:
http://www.tiac.net/users/shansen/belljar/xray.htm
Be sure to read the section on radiation dosimetry.

# 4996. Req: info on mod'ing a 2-meter for Fire/Med band use

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-04 00:00:00 UTC
From: Chris Schmierer <jedichris@usa.net>
Message-ID: <3486E611.7BB9@usa.net>
Source record: 88582

Hi...
Just wondering if anyone has had any experience modifying a 2 meter radio, either a mobile or HT, so that it can transmit outside the 144-148 range. I know a lot of them will recieve outside the ham band, into to Public Safety band. I'm just curious to know if anyone has hacked the firmware on any of these so that they can transmit as well.

I'm an EMT with a local ambulance company, and I could very easily just go out and buy a pro-band radio, have it programmed our local fire-net and tac frequencys, and be completely within the law. The prob is that I'd like to have one that's console programmable; so at fire camp I can just punch in whatever frequency I need instead of trying to find someone who can program it. The convenience of direct entry of frequencys, CTCSS and DTMF tones, and all the features that are commonplace on Ham radios that they want to charge you an arm, a leg, and your firstborn for in a genuine pro-band radio is just what I'm looking for. I'm probably sure that the act of mod'ing a 2 meter and using it is probably walking the line of the law, but I figure that as long as I have authorization to transmit on the frequencys involved there shouldn't be much of a problem. All else fails, I can just go to the dispatch center a written note from the police and fire chiefs so I have something to keep with the radio (just to cover my butt legally).

I'm hoping that I can do this with maybe a rat-shack mobile; ya know, one of the 25 watt'ers that's you can car-mount.

Please, if anyone has any info on this, please let me know.

# 4997. Simple question re: HP 141T analyzer

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-04 00:00:00 UTC
From: John Miles <jmiles@pop.removethistomailme.net>
Message-ID: <3486D96A.3093@pop.removethistomailme.net>
Source record: 88583

Just got one, no manuals yet. (Somewhat embarassing) question: how does one remove the pair of plugin modules from the 141T mainframe?

There are no handles in sight, and the sliding lever between the IF and RF modules doesn't appear to want to budge while the modules are in the mainframe. The modules don't want to simply pull out of the mainframe cabinet, the way they went in.

thanks for suggestions!

Wow, I remember that book! That's one of those volumes that I really
regret having lost hold of. Remember the Homebrew rocket article?
(As I recall it was pretty much a pipe bomb with a hole in the
bottom). If I had found a source for dry ice I might have actually
built the cloud chamber. And I probably missed out on making a
fortune as a hardware hacker by failing to experiment with the
relay-based computer project.

Anyone know where we can get copies of this masterpiece? I went to
Amazon.com. They listed a version of the book from the mid-80's but
I fear that this edition may be a watered down version of the book we
remember (tamed down by the influence of the nanny-state). They were
out of stock, but I put in an order anyway.

Will check out the index.

Sounds like it had all the key ingredients of a great project!

Lacking any cooperation from the Naderized magazine that once was
Scientific American, it sounds like someone needs to hit up a university
library and transfer the microfiche of all of Stong's columns to
bootleggable .PDF files.

That will not "cover your butt legally". Local police and fire authorities
have no jurisdiction to waive federal law. And if they acknowledge that
they know you are operating illegally, they put their department's license
in jeopardy. Do you really want to be responsible for getting your
department's license revoked?

Ok, with the present lack of FCC enforcement, it isn't likely to happen,
but it could. To give you an idea of what could happen, our local police
were fined $10,000 per car by the EPA for removing the cat converters
from their cars to allow them to go faster (that cost county taxpayers
over $1,000,000).

And a few years back when the FCC still cared, the Georgia State Patrol
was fined by the FCC for operating radar with a lapsed license (and again
the taxpayers caught it in the neck). I find it particularly disgusting that
members of public safety agencies think that they can ignore the law at
whim. They don't cut the public the same slack.

Well, I haven't received any enlightenment on the 851B filters so far!
:-( I had to replace two of the PC-board-mounted relays in mine with
conventional DPDT relays, and now the 851B meets all sensitivity
specifications in the manual on all bandwidths, where it never even came
close before. However, the IF filters are badly out of alignment, and
the alignment procedure in the manual is so poorly-written as to be
almost worthless. I've spent hours playing with the numerous
adjustments with a sweep generator but have only gotten the vaguest feel
for what I am doing. Possibly there are more electrical problems in my
unit besides the relays that I replaced -- maybe the crystals have aged
beyond the compensation range of the trimmers -- I dunno. I don't
understand the circuit well enough to troubleshoot it properly.

At any rate, I've given up on the 8551/851 for any kind of precision
work. I just bought an ancient 141T/8552B/8554L/8444A to replace it.
It looks like it served a tour of duty in Viet Nam, and is certainly old
enough to have done so, but appears to be in perfect
operating/calibration condition, and the filters are in good shape. The
parallel-port interface you did for your 851 looks intriguing -- I'd
definitely be interested in hearing about the results your friend gets
with the 141T.

Gotcha. There isn't a little black bar with an arrow on mine -- there's a metal tab to which a little black bar might once have been attached, but I have not tried moving it to the left. Gouge marks on the end of the tab indicate that the usual means of moving the tab with this particular instrument involved the use of Vise Grip pliers. :-( I just didn't know the proper direction in which to apply the force, and didn't want to mangle the mechanism by forcing it.

Many tnx!

Agreed. at 9MHz, a 4-xtal ladder works FB for CW. if use varicaps to change BW, they work FB for CW and SSB if you use only one carrier xtal as they are kinda assymmetrical. try it...

Many of the (semi)older CTCSS boards used opamp active filters constructed
with 1% resistors and capacitors and tuned with 10-20 turn pots. With about
4 opamps, you can get the oscillator and bandpass and notch filter outputs.

Nowadays, most probably use custom ICs.

But I agree with Gary that a 555 probably wouldn't stay on frequency well
enough to work for the long run.

# 5014. ft-101-E help

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-04 00:00:00 UTC
From: MLL <mikel@tir.com>
Message-ID: <6680li$jfq$1@ramp2.tir.com>
Source record: 88600

Hi all,
I'm asking for help again....I've got a ft-101-E and it's acting up
the s-meter is not working at all on 10 and 15 meters except when the
signal is very very stong (like 60 over) the meter will move a little.
It works on alc and power out fine.
On 20-40-80-160 it works better but it moves very slow,like the agc is
set on slow.?
Another funny thing is that on 10-15 the reciever seems more much more
sensitive on lsb than usb......
I rescued this radio off 11 meters so who knows what might have been done to
it in it's life. I seem to remember a mod for this rig to help it with
strong local signals could this be causeing it to act like this?
any and all help or suggestions will be very helpful thanks....73 kb8enc

# 5021. Low Power Attenuator Question

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-05 00:00:00 UTC
From: astone@erols.com
Message-ID: <3488F560.1120@erols.com>
Source record: 88524

Hi Gurus:

I was looking for an attenuator circuit that would provide 100-130db of attenuation to permit me to measure receiver MDS. Found a circuit in my 1987 handbook (pg 25-43) and also in Solid State Design. The description of the circuit in the handbook stated that "The maximum attenuation of any single section is limited to 20 db because leak-through would probably degrade the effect of higher attenuation sections and result in inaccuracy." My question concerns the notion of "leak-through." My preference would be to build the circuit with more than 20 db of attenuation per section in order to simplify things and also avoid shielding between attenuator sections. I assume that leak through would be more evident at higher freqs. (perhaps at VHF and higher) and at higher power levels. Is this the case? How much inaccuracy would result using this at HF freqs. (7 MHz) and driving it with a signal generator that puts out less than .1 W and using let's say 3 40db sections that aren't shielded from each other? Thanks for your help.

73,

Ron (KA3J)

> In the various December magazines, Dick Smith advertised that they now
sell IRF520 FETS at $3.95 a pop. Does anyone know much about these
devices? In particular, whether they are similar to the IRF510/511
series, which could put out about 2-4 watts on 80 & 40 metres and less
on
20 metres. If they are similar, it could mean that reasonably robust
PA
transistors for QRP equipment could be as close as your nearest Dick
> Smith store.

> 73,
--

_____
> Peter Parker

_____

An IRF520 has a 9 Amp rating vs 5.6 Amp for the IRF510. They are both
100 volt units. Don't know if they are equivalent in RF
characteristics.

3.95 $US (or is that 3.95 $Aust) is not a great deal. A Canadian
distributor of IR products in Toronto lists them at 1.08 $can in
singles. Unfortunately for you, they don't deal overseas - Pity!!

==========
I fully agree ,however much 'HAM' hardware involves universal
products which not only can be modified by physical changes ,but also
by means of 'soft tricks' ie without opening the equipment. I own a
legal HAM HT which can be set for wide band rx/tx by keep pushing
certain buttons while switching the unit on. It is unavoidable that
inquisitive users find these tricks , although that does not mean
they will ever be using the equipment illegally. In the end it boils
down to personal responsibility and discipline.

the gentleman with the genuine question, thinking that it would be legal for him to use a modified ham radio under his license (a valid question not needing vicious attack from the respected amateur community) should check with the FCC to see what types of radio are allowed under his license. If it says "anything that works", go for it. But, if the FCC requires type accepted radios, as it does with the citizens band etc, it would be illegal to use the modified ham radio.

The problem is, "HAM" radio gear for the most part will not pass freq.
tol. as speced by the FCC for use on pubsafty freqs. Before you can
"leagally" use any radio on the public safty frequencys it must be
certified. Take to a 2-way shop or tech and have it checked out. Your
company or department would be liable if a radio used with their call
interfreared with another departments communications.

The FX315J chip is a CTCSS tone generator. It needs a 1MHZ ceramic
resonator and 5 components to produce 1 tone, with a dip switch tones
are selectable. The FX315J is available in the UK for 4.50 pounds from
RN ELECTRONICS.

: jedichris@usa.net

Some notes:
1.most ham units can be modded to cover the frequencies you require.
2.it would be a violation of your agencies license to use it, except in a
emergency.
3.you can get commercial portables that are field programmable-these would
be legal, and may very well perform better.
You need to determine how the radio you are considering is programmed-if
it needs a special programmer or a computer, you would have to carry it
with you.
The radios you are looking for can be programmed from the front
panel-either the keypad, or switches can be used for this.

Many companies make/or have made in the past, gear that can do this-you
will often have to go inside the unit once, and pull or add a jumper.
In some cases, you will need to enter a password as well.
ICOM,Kenwood,Midland are some companies that I KNOW OF that made some gear
like the above.
I believe that Regency(RELM) has made suitable gear too.
Other companies may well have them as well.

Source record: 88614

Ok, guys and gals, I just want to go on record as saying that I'm not trying to violate the law or anything. I appreciate all the people who pointed out that I would be stepping way over the line by operating a mod'ed radio for PS use. Call this one of those informational questions, I was just curious if it could be done, what technical details I would run into, and what legal BS I would have to go through. Apologies to any serious hams I offended with the idea of fracturing the FCC code.

As to the original question, someone mentioned that ICOM, Kenwood, Midland, and RELM (used to be Regency I think) all made actual Professional radios that could be keypad programmed. Any details on this? (Model numbers, which jumpers need to be pulled, passcodes needed). I know that the Motorola Spectra (mobile) radios we have in our ambulance rig are supposed to be able to be programmed from the keypad, (if you know the right keypad combos). If not, I've got a little palmtop PC clone (8086 equivalent w/ a 512k pcmcia flash memory disk), that I could probably upload any programming software into (depending on the size). Any info anyone has on related subjects would be helpful.

I'm still interested in any info on mod'ing the firmware on a ham rig, given that they tend to cost less than a pro band rig, some have very similar frequency tolerances, and are a lot easier to get (ask a Rat-Shack guy if any of their VHF hts are PS band compatable, can be field programed, and come standard with CTCSS/DTMF options; and watch him drop to the floor in fits of laughter). To appease the lawyers in the group, I'm requesting this info for informational purposes only. I promise that before I use it, I will deal with the legal issues.

Once again, I apologize.

Chris

My balcony is the length to yours. I would suggest the following (which I have up at the moment):

10m: 1.8m mobile whip on mobile base mounted on balcony

40-15m: Tuned feeder dipole fed with open wire line. Have it 15m long, have ends over side of building if possible, or bend back. My antenna is against a brick wall - still seems tro work OK though.

80m: Magnetic loop antenna of some description. Mine is indoors and 1.5m square, though the bigger the better. Some info appears on my web page.

With this set up, I've recently worked Europe on 10m, many DX stations on 20m CW QRP, USA with 5w QRP on 40m and about 3000km with the indoor 80m antenna with 20 watts SSB.

Source record: 88529
Cross-posted to: aus.radio.amateur.misc;,rec.radio.amateur.homebrew

In the various December magazines, Dick Smith advertised that they now sell IRF520 FETS at $3.95 a pop. Does anyone know much about these devices? In particular, whether they are similar to the IRF510/511 series, which could put out about 2-4 watts on 80 & 40 metres and less on 20 metres. If they are similar, it could mean that reasonably robust PA transistors for QRP equipment could be as close as your nearest Dick Smith store.

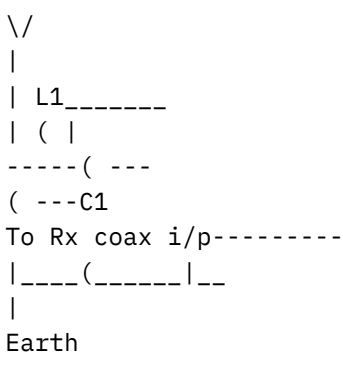
>Thanks, -K2
Hi Keith,
I am afraid your idea will not work (at least in the manner you describe). If you need an all band end fed wire antenna, your best bet is to use an ATU between the wire and the Rx. Indoor antennas 'may' suffer from pick-up of unwanted domestic rf noise, but you may well get away with it; many do. The following is an extract from an earlier posting of mine which may help:

Snip

May I suggest the following:



C1 Approx 300pF variable
L1 60 turns close wound on a 2 inch former tapped every ten turns
By trial and error, tap the wire aerial down from the top end of the

coil and the Rx i/p up from the bottom whilst tuning C1 for max signal. Generally the Rx tap will be just a few turns up from the earthy end; the Ae tap position will depend upon the length of wire and the band in use. To clarify the diagram above, the Rx coax braiding is connected to the earth end of the coil. A separate earth or counterpoise wire should be connected to the earth point but this will still work without either.

The wire aerial need not be particularly high for receive purposes, but bear in mind that a low wire may well pick up unwanted interference from domestic sources. The length of wire is immaterial but I would suggest a minimum of 33 feet preferably 66 feet upwards. On some bands you may find performance better without the tuning unit; for example: with a 66 foot wire on the 3.5MHz and 10MHz bands where it is a quarter wave and 3/4 wave length respectively. Initial setting up may take a little while but once the tapping positions are known, it is easy to reset. The taps can be connected via a switch and the unit boxed if required or the whole thing may be breadboarded and the taps changed by the use of croc clips.

Best of luck, 73 Trev G3ZYY ...-.-
PS. I used this system on 160m to 10m Tx/Rx in the 70s and it wkd extremely well.

>aren't shielded from each other? Thanks for your help.

Sorry, I don't think that will work. Nobody can measure 120dB
attenuation in a single swipe (1GW in -> 1mW out!) so even someone with
access to lab equipment has to divide the attenuator up into measurable
sections such as 3*40dB and has to make absolutely sure they are well
shielded from each other.

If you can't measure a 40dB section either, but are relying on accurate
resistor values, then you MUST use conservative construction methods
that you can depend upon. That means limiting each section to 20dB -
just like it says in the book - and shielding each section carefully.

The other thing you need to consider is the shielding of the signal
generator, especially if your receiver under test is not well shielded
too. Most signal generators leak much more than -120dBc, out of the gaps
in the case, out of uncapped front-panel sockets, and out of the mains
wiring. Then there's leakage through the coax between the generator and
the attenuator (you have to use hardline), and leakage out of the
coaxial connectors...

...from which you may gather that accurate MDS measurements using a
signal generator require fanatical attention to detail.

You won't get meaningful results until you change your whole mind-set
from "What can I get away with?" to "I'm gonna make absolutely certain
this is OK!"

You can't do this with a single attenuator. I had endless problems with
leakage trying to do this of thing where I used to work with a couple of
military manpack transceivers. I had to use two screened rooms, lots of
attenuators and double-screened cables.

The IRF520 is the next one up in the series - higher current, lower on R.
This comes at the price of higher input and output capacitance and slower
switching times. Don't know how it will affect 3-4Mhz operation, things will
get worse at 40M and 20M for sure.

Some data for 510 VS 520

C in 135pf typ VS 350 typ
C out 80pf typ VS 130 typ
turn on delay typ/max 8/11ns VS 9/13ns
rise time 25/36ns VS 30/45
turn off delay 15/21 VS 18/29
fall time 12/21 VS 20/30

I think you need to buy some glasses bry! Who mentioned 'brand'?

Again, if he tells me what BAND he wants plans for I can help!

To help me learn some radio electronics, particularly dealing with antennas, I'd like to buy a noise bridge. Preferably with manual, and certaily in perfect working condition (nothing more frustrating than trying to learn with faulty equipment!). If you have one for sale, please email me directly. Thanks, Keith N3KXZ email jko@ezonline.com

coax sockets may carry RF in respect to chassis ground, in this case
ferrite ring cores on cables might improve the leakage, try the
clip-on types.

I use it for 6 and 2m, but I am not pleased with the original version,
it is a lot of improvements worth doing. "Everybody I know" had
problems with instability in the output stage, BFR96 seems to be
better than 2N3866. A 1dB pad between output stage and output
connector might improve stability.
I have added a 2N6083 (19dB gain) 20W PA to the 6m transverter and a
2N6081 2,5W PA to my 2m transverter.

Hi Paul,

the German UHF/SHF magazine "UKW Berichte" (Postfach 80, D-91081 Baiersdorf, Tel.: ++49-91 33 / 77 98 - 0, Fax -33) has published three spectrum analyzer circuits, one being a more complex but modular system (issues 2/87, 3/87, 1/89, 2/89, 1/90, 1/91, 3/91 and 2/91) with an optional tracking generator. At least for this circuit ( 1 MHz - 2 GHz, approx. 100 dB dynamic range) a kit is available (price is 1000 DM - 1500 DM, depending on the options).

Back issues of "UKW Berichte" are still available.

There is also an english edition of "UKW Berichte" called VHF Communication (representative: KM-Publications, Mike Wooding, 5 Ware Orchard Barby, Warks CV 23 8UF, UK ).

Three more spectrum analyzer projects have been published by the UK magazine ELECTRONICS WORLD / WIRELESS WORLD. One of these analyzers (issue 12/93) comes with a tracking generator. With this analyzer standard TV tuners are used as VCO, mixer and IF ampifier.

In addition to all the other good advice look up specifications
for "Waveguide Beyond Cutoff Attenuators". These are two sections
of coax with coupling loops and placed inside a small tube. The
attenuation can be calculated from the dimensions. They are easy to make.

You may find it interesting that there is a software spectrum analyzer using your soundblaster. I've been running the software for a couple of day and I find it fairly useful.

Do a webcrawler search for 'spec for windows' or 'software spectrum analyzer'.

Source record: 88553

International Radio (www.qth.com/inrad) sells all kinds of filters, both "drop ins" for commercial gear and 9 MHz "for experimenters". Their specs look OK but they want $100 - EACH, which is too steep for me! TenTec (www.tentec.com) uses 9 MHz and 6.3 MHz filters in their gear, and sell their filters at $80 or so, which is still out of my range. The QST articles mentioned in other posts have all the data you need to design & build your own, if you can get crystals of the right frequency, at the right price.

What do you intend to build? I'm always looking for lowcost multiband HF transceiver designs.

Source record: 88555

Beware of input/output capacitive coupling of the components themseleves as
frequency goes up. Also component lead inductance to ground lowers the
effective attenuation. You defintitely need shielding between sections.
Coax shielding, RF
connector leakage has to be watched out for at VHF and beyond.

Chuck KD9JQ

# 5070. FS surface mount parts for experimenters and prototypers

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-07 00:00:00 UTC
From: baggybob@elknet.net
Message-ID: <baggybob-0712971644390001@usr-ppp-6.elknet.net>
Source record: 88556
Cross-posted to: sci.electronics.components,rec.radio.amateur.homebrew,rec.radio.swap,misc.industry.electronics.marketplace

HI ! We're back again. Rehabbing an old house has taken most of my spare
time and scattered my boxes of parts. As requested b members of the QRP
mailing list here is: baggybobs' buck a bag bargain bonanza
brought to you by bob & kim
.
Surface mount parts for experimenters/prototypers
all new surplus unless otherwise noted

Shipping to the USA
Small parts orders (less than $35 usd ). I ship by priority mail. Cost is $3
Larger parts orders I will ship by UPS using an agent. Cost is $5
I ship UPS COD only upon receipt of $10 deposit. The UPS depot is 60 Km
away. I have to drive there and handle CODs myself. I cannot afford the
cost or hassle of refused COD shipments.
Really small parts orders (up to $5 surface mount parts only). Send me a
SASE with three stamps. I will put in some foam filler to prevent damage.
International orders require international money order or funds drawn upon
a US bank. We can determine together the best way to ship.
.
If you have tech questions please e-mail. I will answer in a day or two.
Address:

Hi Peter,

I recall, from somewhere, that a ham documented a 26 GHz spectrum
analyzer design. Have you heard anything about this, or know where to
find the articles?

# 5075. $500.00 USD Reward for design...

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-08 00:00:00 UTC
From: marcianti@sprintmail.com
Message-ID: <66hb1a$2dq$4@newsfep1.sprintmail.com>
Source record: 88470

$500.00 USD REWARD!

Calling all RF designers.

I am in need of single frequency FM transmitter with the following specifications:

1. single frequency within 87.9 and 107.9Mhz
2. minimum parts
3. radiated output less than 250uv at 3 meters
4. bandwidth less than 200khz with signal centered on operating frequency
5. non-stereo
6. line-level input
7. must be able to change operating frequency easily
8. operate on 9-12VDC
9. matched telescopic antenna
10. parts must be easily obtained without special orders
11. can not be previously copywrited (stolen) design

Will pay $500.00 USD for successful design and an additional $500.00 after full FCC certification. I will retain all rights of the design without further compensation of any kind.

email to Paul J. Marcianti

The TAPR assembly and system manuals for the TNC-2 (with command references updated to 1.1.8) are available on TAPR's ftp site (ftp.tapr.org in /tapr/software_lib/tnc). The MFJ manuals were adapted from these.

# 5081. Respirators

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-08 00:00:00 UTC
From: martin@a.cs.okstate.edu
Message-ID: <66huq$4f8@news.cis.okstate.edu>
Source record: 88476

Am I just imagining things or is there an industrial type
respirator that works along the lines of an army-style gas mask in which
the filter is on a short length of hose such that you can hang it on your
belt?

I like to salvage circuit boards with a paint stripper gun and
I don't think it is a good idea to breathe the fumes from the flux and
conformal coating that come off when the heat is applied. I usually do this
outside, but still, the fumes get pretty strong and an air intake that wasn't
directly in the line of fire would help quite a bit.

# 5082. WWVB reception

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-08 00:00:00 UTC
From: Ted Kester <tk1932ga@atl.bellsouth.net>
Message-ID: <348C99C6.541E@atl.bellsouth.net>
Source record: 88477

Some weeks ago I asked this NG for a signal report on WWVB to determine if signal strength from Boulder was good enough to consider building a receiver. I received reports from enough surrounding areas to make the project worth a try. Futher research turned up several ciruits, articles, and helpful advice from fellow amateurs. I turned up a single chip WWVB receiver from TEMIC, a subsidiary of Telefunken that produces digitized output compatible with microcontrollers. I would love to get my hands on this chip,but none of the online distributors I checked had it in stock. NOT A NEW STORY FOR HOBBYISTS!

My brother from Pennsylvania suggested I a look at a "radio controlled" clock kit he had bought but had not assembled. I had him read the description to me and I was amazed to discover that he was describing a clock that was controlled by radio from WWBV in Boulder. I immediately ordered one and I now have an operating analog clock that is self-setting and is as ACCURATE AS WWVB. The cost for the black-box module was twenty-eight ($28.00) USD. The module is a black platic box about 2 x 4 x 3/8 inches and is a self-contained analog clock driven by one (1) AA cell. There is no external antenna. For your money, you get ONLY the clock module and a set of hands... 40 cents gets you a SWEEP second hand. I bought an unfinished case for mine from a local craft hobby shop.

I completed the clock and inserted the battery at 8:30 PM EST on Sunday December 7th with all hands set at the 12. After an hour of intense "clock watching", the clock still had not set itself. However, this morning (Monday the 8th) at 5:30 AM the time was set and I assume synchronized with Boulder. I'm still going ahead with my digital project, but I thought the NG would be interested in the analog solution.

I got the clock from KLOCKIT in Wisconsin. They have an InterNet home page which is outdated... Their phone number is 800-556-2548

Cheers

Those amps have to come from somewhere before you can process
them with 2N3055s and such.

Power supply design is discussed - at length - in all the usual
reference books. People write books about it. Horowitz and Hill
discuss it particularly well in chapter 6 of _The Art of
Electronics_, a book every ham should own anyway.

Sure is.... We use 'em at work. Kinda pricy new, maybe you can find surplus? Meeting OSHA/NIOSH specs etc.drives up price. There are a few manufacturers, but the one I remember is MSA (Mine Safety Appliance?) - Try a search on Mine Safety *
It is like a conventional gas mask with corrugated hose connected to a battry powered blower filter. Caled a PAPR (Powered Air Purifing Respirator).

A secondary problem may be relaesing the fumes into the room at all. How about a plywood (or metal) fume hood with a blower feeding clothes dryer hose to an outside vent?

>
> Burt VE2BMQ>>>

Hi Bert and Peter,

Unfortunately, the higher the rated current and lower the Rds on
(ohms),
the higher the input and output equiv capacitances. So the
higher-current
FET will have more limited frequency response. I have been unable to
get
any significant power from IRF522's on 20 meters, but a pair gives an
easy 40W
out Class C on 40 meters, with a 24 V supply. The rise and fall times
are
becoming significant fractions of an RF cycle even at 40 meters (one
cycle at

7 MHz is 143 nanoseconds).
I prefer higher voltage, lower current FETs.
I would not expect to pay over 75 cents or so for an IRF520 or the
like;
4 dollars each is not a good deal.

73,
Don, W6JL

On Fri, 05 Dec 1997 22:49:04 -0800, astone@erols.com wrote:
Hello Ron,

You may be missing the point on the MDS measurement. I know of no reason why one would need such a large attenuator. The idea of MDS is to know what signal level is injected at the front end. With a known attenuation from the attenuator and a known (i.e., reasonably well calibrated) signal generator output, then you can measure MDS with a wide range of signal sources and attenuations. In your case, the only reason that I can imagine why you would want to have so much attenuation is that you are starting out with too high a signal source. Let's say that you have a 1 volt rms signal generator that is going to be your signal source, but that it has an internal output attenuator that gives you calibrated outputs down in the 10's of millivolt range.

I will assume that the signal levels that you need to inject at the receiver front end are around 1 to 2 microvolts. Quick calculation there of 20 log(20 mv/1 microvolt) = 20 log (20000) = 86 db. That would not be nearly as big of a problem as the 120 db attenuator that you're speaking of.

In fact, if the signal generator is like I think it would be, the calibrated outputs would be available down in the 1 mv range, which would mean you would only need perhaps 60 db of attenuation. Are you sure that you really need 120 db?

Seasons Greetings everybody,

After success with a few QRP xmtrs and DC rcvrs, I want to build a receiver. After days of WEB cruising and reading in the library, I decided on a W1FB design, the Unversal Superhet from the W1FB QRP Notebook (see page 165). I want to use a 455 KHz IF and mechanical filters. The question is about the BFO. Is a STABLE BFO difficult to acheive at 455KHz? Should I use a variable BFO to simulate IF shifting? How about a switched BFO for USB and LSB? I have a proven VFO design for 2.155 MHz to 2.555 MHz. Any advice on the BFO will be appreciated.

Frank - ideally you would use two 455 kHz xtals, one for LSB and one for USB. Their frequencies would be close to the extreme ends of the 3kh-s wide filter passband - see what the handbooks say about SSB transmitters - the same principles apply.

Alternativly you could experiment with 455kHz ceramic resonators - it may be possible to shift it to cover both USB and LSB positions. A free-running BFO should be reasonably stable also - you could experiment with VFO circuits using 455kHz IF transformers as the inductor.

73,

>K7RMJ
>Frank

Frank: You might want to consider Doug DeMaw's "Barebones Superhet"
From the July 1982 QST. It uses a 3.579 Mhz (colorburst crystal) IF.
The crystals are very cheap - just a few bucks for a bag of 50. For
the BFO you can use one of the same rocks with a small cap to shift it
700 hz or so. I've been very pleased with this set up here. Built
a three pole filter and I think the selectivity is around 400 hz.
For SSB I built a little one crystal, one resistor filter that I can
switch in. Sounds good two.

Good luck with the superhet. I found performance to be FAR superior
to the DC receivers. And not much more difficult.

> the average price for a good antenna? Your help is greatly appreciated!

Your asking a lot! I doubt you will find a new ham radio for under $100
these days. However, you might find a used radio for under $100 (I
bought a two-meter handheld for $100 in a pawn shop once). The antenna
thing is a whole new issue and the cost could range from a few dollars
for parts to build your own or several hundred dollars to buy and
assemble one.

See http://www.arrl.org for information about all you need to know
about amateur radio and, until you get your license (and even after) see
http://ld.net/?kc5fm for low cost long distance service.

Let me know how more I can help.

Cool! Besides changing the breakdown voltage, it also makes it a
wider ratio between min and max capacitance than might otherwise be
possible. Clearly, someone had a reason for going to all that trouble.

We are a group of microwave amateurs, our experience with fets in
oscillators are not good. Bipolar type butler oscillator is much
better, but it is many things which may go wrong. G4DDK has made a
very good LO design which is now copied by almost every UHF/SHF
amateurs in Europe. Some of us thought FET (J310) xtal osc was better,
but we were wrong. The FET oscillator never was as stable as the
butler oscillator. When many copies were made of similar circuit, 20%
were bad. It is two different Butler configurations, the more common
type (butler common-base as used by G4DDK) and the butler-emitter-
follower, which is difficult to design, but may work better.

Peter:
Saw your item on newsgroup abt the IRF520 at HF. You can positively use these devices at HF! See my article in QST,Dec 1986 or reprinted in "QRP CLASSICS" from ARRL (pg 69). The IRF520 ran 16-20 watts out at 80 Meters with 12 VDC. The IRF510 will put out 12-15 watts on 40 and 30 meters. I can mail you the update to this article which basically shows a better frequency doubling scheme. Many QST readers wrote in about these, some saying that with more supply voltage (+24) they got more power. I am not this brave (yet).
Not published are 10 watts at 17 Meters and 6 watts at 10 meters, all with 12 VDC on the IRF510. The latter is used at 4 Watts for a 10 Meter Beacon at 28.2082 (AK2F).
Good Luck with your Homebrew>>>> 73's de Mike <wn2a@qsl.net>

>fair.
>
>I am looking for ones that are usable for 9mhz IF
Buy 10.7MHz preferably on the surplus market OEM prices are generally
$10 or less.
Ripple is generally a function of the termination try 910 ohms a
standard.
Amplitude ripple may be flat but group delay needs seperate
specification if you want data.
Try Toyocom monolythic duals at 10.7 mhz isolate each stage with a small
gain block then you cal roll your own (including group delay) with
great sucess

It is usually not possible to increase the output of an already
built power supply by a factor of 2, or more, without a complete
redesign. And it generally turns out in the end to be not cost
efficient.

Well, now, as time goes by the definitions must change, I suppose.
Now-a-days anything built with discrete transistors is pretty much
a (small) boatanchor.
My TS-520's are boatanchors -- just 3 tubes and the rest transistors.
My IC-22A is a boatanchor -- all transistors AND CRYSTALS!!

Run outside and locate the running board on your car. <g>

It is usually not possible to increase the output of an already
built power supply by a factor of 2, or more, without a complete
redesign. And it generally turns out in the end to be not cost
efficient.
Roland, KB8XI

Your limiting factor is likely to be your transformer. For example, if you were, for example, to try to build a 13.8V 15A power supply, and try to buy the transformer off-the-shelf (assuming you can find one), you'll probably pay more for it alone than for an already-built supply at a decent-sized electronics flea market (if you get there early and/or you are willing to go more than once to find it). So you'll most likely find that the transformer in your existing supply won't do what you need. If i had to build such a power supply, i'd probably look for a used battery charger at a conventional flea market and cannibalize it for parts.

Now, moderate-to-high current 5V supplies are plentiful at electronics surplus stores and pretty cheap at electronics flea markets. So, if that's what you need, go get one. Almost anything larger than a coffee cup that isn't a 'wall-wart' will probably deliver several amps at 5V, (but check the rating). But if it's really 13.8V you need, one thing that the locals have suggested is getting three comparable 5V supplies (identical if possible), crank them down to 4.6V, and run them in series. (But don't try running two "12V" supplies in parallel unless you really know what you're doing!) Good luck.

Hi
I am planning to build and test S53MV Matjaz SSB direct conversion transceiver. Dynamic range is said to be a problem with this type receiver. S53MV circuit uses LM324 type op.amp in LF-stages. This is quite noisy, wouldn't TL084 have lower noise, so one may receive a weaker signal and need not have so much RF gain?
Any ideas for how to improve the dynamic range?
S53MV and other mentions that this design is more ideally suited for 23/13/6/3cm transceiver where usually it is only a few weak signals at the time
This transceiver project is described in 1997 Scriptum des Vortr�ges, Weinheim, Germany and DUBUS info nr 3/97 (october) and 4/97 (??) with PCB lay-out, DJ9BV explains the theoretical background.

Hi
I am planning to build and test S53MV Matjaz SSB direct conversion transceiver. Dynamic range is said to be a problem with this type receiver. S53MV circuit uses LM324 type op.amp in LF-stages. This is quite noisy, wouldn't TL084 have lower noise, so one may receive a weaker signal and need not have so much RF gain?
Any ideas for how to improve the dynamic range?
S53MV and other mentions that this design is more ideally suited for 23/13/6/3cm transceiver where usually it is only a few weak signals at the time

Such a deal.

If I thought I could whip out the design in five hours,
I'd take a shot at it.

I ahve to wonder, though -- if he's offering rates this low,
what's to keep HIM from pirating all the winning designs we
send him? I didn't see any mention of contractural obligations
in the post other than a promise to pay.

On the other hand, why doesn't he send the design work off-shore
to Albania or some place where engineers will work for 25 cents
an hour?

Finally -- what's wrong with any of the multitude of FM
transmitter kits on the market now, in a decent tin box
with a decent output filter? I mean, we ALL remember what
a smashing success Mr. Microphone was!

Just have to mention this...in the December 1997 QST, in "Up Front," Bob AF6V's tube bank was mentioned. He _gives away_ tubes if you pay $5 shipping. The short article didn't say if that was per tube, or per small shipment of tubes.

One tube in a box, via USPS Priority Mail, will earn Bob just under a dollar after he buys the packing materials. I think that's reasonable, especially after the last time I tried to replace a tube in a VFO and got my wallet seriously lightened.

You might give him a try. I bet Bob is good in the Callbook if you don't get QST.

> 144-148 range.

Most of us have. The ADI-600 is keyboard reprogrammable
for this feature. The difficulty or availability of the mod
depends on the rig, and this may influence your buying decision.

On most 2 meter rigs (except RS), especially synthesized rigs, the mod
is easy and works FB. I modded my Azden PCS-6000 for "extended
coverage." Desolder one diode. For me, the hardest part was re-
entering all the frequencies into the memories. On this particular
rig, it opens up the receive as well as the transmit -- I wanted the
receive capabilities.

Since it's not FCC type-accepted for the extended coverage
frequencies, it's not legal to use it to transmit there.
This goes for any 2-meter rig. As always, the station operator is
responsible for ensuring legal operation. YMMV.

Hello guys,

i bought last saturday my first Amateur radio ( its a Yaezu FT-707
or FT-702 i will check it latter...) well, it has 80,40,30,12,15,10(four)
bands and i would like to *make* a simple antena, transmatch system to
start trasmiting something, preferebly on all of this bands.I have a simple
wire right now ( receive only of course :) since i didn't have the time to
even buy coaxial cable.
I have and checked 1995 ARRL Handbook and Antenna handBook and it gave me
some *ideas*, but could you give more?
I also have in mind, by some time, to build a receiver that apeared on
Elektor Electronics, which used a TV Tuner and a NE605 to cover all the
VHF/UHF FM/AM bands.
The problem is the *TV-Tuner*. I have several at my home but were can I
get the *pinouts*?
Other thing:) Can anybody tell me were can i find information on
the following chip LC324256BP-70 ? I checked Sanyo Site and they only have
the PDF for LC32464. Its a DRAM chip that i got from a Cirrus Logic 5424
VLB graphics card.I have 16 chips like this one, but i think some of them
are broken. I would like to use some to make a simple scope using it
with a Maxim ADC and some software, and some of the others to some uP stuff i
have in mind.
And about Toshiba TC5565APL-15 and NEC D43256AC-12L pinouts ?

Thank you very much for your help!

# 5135. amplif. with 2C39 or 4cx250

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-10 00:00:00 UTC
From: PDingemans <129432pd@student.eur.nl>
Message-ID: <348E91C8.6BE47697@student.eur.nl>
Source record: 88428

G'day,

I'm planning on building an amplifier for the 2 metre-band, using a 2c39 (preferably) or 4cx250 (less preferably, because of screen & grid voltages needed). The problem is, that I have lots of schematics for the 4cx250, but they all use Lecher-lines or strip-lines. What I want to try first is using ordinary coils & caps. Is that still possible at this freq.?

Other problem: I would prefer to first try to make an amp using a 2c39, since I have never before worked with valves. Problem is, that I can't seem to find any schematics for the 2m-band using the 2c39... Is that simply because they don't exist, or haven't I looked hard enough?

My question to you is: does anyone know of schematics for the 2c39, and if so, could he point me out on where to find them (or perhaps e/s-mail them; costs will of course be refunded).

Thanks in advance,

73, Peter Dingemans.

Bill: Thanks for responding. I almost chose the circuit you mention,
However, a few years ago I built a receiver from the QRP Classics called
A Four Stage 75-Meter SSB Superhet with some success. I used the
reccommended 9MHz single-crystal scheme with a 9.0015 MHz BFO crystal.
I have to agree, the performance was better than the DC receivers, but
it was still lacking for my needs. (I'm a hard-core CW man) The
circuit you mention is lacking in Selectivity and it lacks a good AGC
system. The circuit I chose may also be lacking in selectivity and it's
AGC is questionable in my mind, but I like the IF stage (two MC1350's
instead of one), and the S-Meter circuit. With two amplifiers in the
IF strip, a good AGC is acheivable. Good AGC being without "thumps" and
"pops". Anyway, I thank you for the interest and your response.

Peter - Thanks for the response. Your post has given me the solution.
As usual for me it was a BFO (Blinding Flash of the Obvious)...pun
intended. Two crystals, one for each sideband, and a variable circuit
on both of them. Your comment about ceramic resonators is very
interesting. Did I read somewhere that they were a bit noisey if used
in an oscillator??

Regards and thanks again.

Happy Holidays,

Frank...K7RMJU

I have read with interest this article.I tried to procure the balance of
the article from Dubus who informed me it is a four part article which
only will be available in the magazine.Part two is scheduled to be
shipped 12-15-97.
I am so unskilled in digital circuitry to only suggest that the
utilization of DSP would appear to offer a order of magnitude
improvement in a practical implementation of the Weaver method.I guess
I'll have to wait for the more experienced to publish a design that I
can duplicate. 73 Ken W6GHV

If you are going to connect a DSP, then there is no advantage of using
the Weaver, or "Third Method".

The whole point of the idea is to provide the needed 90 degree shift
at the audio freguencies. Both the phasing method and the Third Method
start similarly, in that there are two product detectors (we are talking
about receiving here), and they are fed from a bfo, via a 90 degree
shift network. The phasing method takes the audio outputs from the
detectors and combines them via a 90 degree audio phase shift network.

The Third Method takes the detector outputs, and feeds them into
a second set of mixers, these operating at audio frequencies. The
"bfo" to these again comes through a 90 degree network. The output of
these mixers has a 90 degree shift, and is more or less the same
as with the phasing system, after the audio phase shift network. (Yes,
this is a simplified explanation, both in circuit info (there
have to be filters) and theory.

The advantage of the Third Method is that instead of having to
get a wide band 90 degree phase shift network, with all those
precise capacitors and resistors, you need a single frequency
90 shift network, at the frequency of the "bfo" that feeds
the second set of mixers.

But if you are going to try to connect a DSP, which will do
the audio phase shifting, there is no need, and I can't think of a
reason, for the second set of mixers and the associated circuitry,
because the only purpose they serve is to do the audio phase shifting.

I'll try and dig up some articles on The Third method, and post
a bibliography later.

Hi
Tom Twist(LB8X) and I are planning to build the G3LDI 3-M antenna impedance bridge *) and use AD-converter and modify software, we hope to find a simple and inexpensive circuit for later publication.
I need 5 equal diode RF detectors. We will prefer to use some commonly available diodes.
AA118, AA119 or 1N270 germanium diodes will work satisfactorily beyond 1000MHz, but they are difficult to find. The only available germanium diode in some quantity is 1N34A (and OA85), they have proven not particularly good over the frequency range. So I have made a test circuit using 1N4148 made on a small piece of single sided pcb

laminate, using short wire ends for good VHF practice.

The result is shown below. I am sort of dissappointed, it seems that inspite of having low capacity, the 1N4148 (1N914) have not particularly good detected level vs frequency data.
We will use some software program to calculate between the 5 different detected voltages, we may have to use some frequency calibration, too.
Keeping the actual RF voltages higher than 100mV it seems possible to use the inexpensive silicon diode as an RF detector.
1N4148 as RF detector diode.
---
detected level vs frequency for the detector shown below:

```
-----|--1nF---|-1N4148*-|-----|-----|------+out
RF in | | | | | to Fluke 8020B
BNC 56R 1N4148 1000pF 10nF 1M
-----|--------|---------|-----|-----|-----gnd
```

Detected mV DC @frequency
Level 5MHz 15MHz 25MHz 35MHz
30mV 2.1 1.8 - -
100mV 10.1 9.0 8.0 6.7
200mV 72 64 57 48.5
250mV 143 130 118 100mV
300mV 234 214 195 170
400mV 438 409 380 340
500mV 640 605 571 520
700mV 1157 1110 1055 976
1V 1964(920) 1900(750)
1.58V 2960(1380) 2370(1140)

Measured with Wavetek Model 3001A signal generator
and Siemens 3W518 Pegelsender
1m RG58/U coax cable
() refers to a circuit where second 1N4148 is
replaced by a 100k resistor.

>

Seasons Greetings all...

I received a number of email requests for more information about the receiver project mentioned above. So, here is a summary of where I am so far. Keep in mind a lot of this is heavily influenced by W1FB's research and publications. The receiver requirements were to be as follows:
1. It MUST BE STABLE!!!
(I am tired of retuning every 10 minutes)

2. It must have good selectivity and IMD performance.

3. It must have sufficient gain to allow good agc.

4. It must be at least as sensitive as my old TS-930S.

5. It must have an S-Meter (for guesstimating purposes).

6. It must be simple enough for an experienced ham to build (tic)

For stability reasons, the VFO frequency is kept as low as is practical. We are talking analog VFO here, not a frequency synthesizer. A tuning bandwidth of 400 to 500 KHz would cover the cw portion of most bands. 455KHz is very popular as an IF frequency and will allow down-conversion from the VFO to the IF. On page 54 of W1FB's QRP Notebook, I found the same VFO circuit of DeMaw's that I had built more than once with very good results in previous home brew receivers and a transmitter. (And best of all there is a PC board available from FAR Circuits...the side of my PC now has an interesting splash of orange freckles on one side)

So, it looks like 160 meters is a good choice of frequency for stability reasons. Converters can be added for more bands later.

This would make the receiver a "Tuned IF" receiver.

Selectivity, IMD and overall gain make the IF stage gain requirements go up, thus requiring more stages of amplification (just so the AGC can knock the gain back down again). This requirement sent me back to the books again. W1FB again came through for me with his pair of MC1350's in series with a Collins mechanical filter in front of them See the Advanced Superhet Mainframe circuit on page 165 of W1FB's QRP NOTEBOOK. (And, there is another PC board available from Far Circuits...the matching spots on my desktop will be happy to hear this)

The AGC section of this receiver is a simple audio AGC system which also drives the s-meter. Even though it isn't mentioned in the accompanying article, I suspect this AGC system will have the thumps and pops that are typical of an audio agc system. However, I might just give it a try as designed just to get it working before I tinker it to death, and I know where there is a receiver design with a much better agc system, so I can change it later. I have an older copy of Solid State Design for the Radio Amateur (second printing 1986) which has a very good design for a 160 meter, high performance receiver. The agc system gets it's input from the output of the last IF amplifier rather than after the output of the product detector. I want to try this circuit in my receiver eventually. (see page 137 fig.39).

This is about where I was when I posted the help with the BFO. From the answers I received, the BFO will be a two-crystal affair, one USB and the other LSB, and a circuit to bend them a few KHz. I found a likely circuit in W1FB's Design Notebook, figure 5-15. A little tinkering and I think I can get those crystals to pull off freq a bit. (And, there is another PC board available from FAR Circuits... that will make the Mrs. happy... we don't talk about the floor tile I replaced)

So now it's back to the Dan's parts catalog and the FAR Circuits catalog and a battle with my checkbook.

Hmmmm.... I wonder what I am forgetting??? Comments? Constructive criticism is ALWAYS welcomed.

Regards, 73's and Happy Holidays to all...

It's used for soldering surface-mount components which have gold or palladium-silver terminations, and for soldering on silver-metallized hybrid circuits. If conventional Sn-Pb solder is used in these applications, the component metallization will be rapidly leached off the component or substrate. A little spool of this kind of solder used to be wound on one of the rear legs of Tektronix 'scopes. You needed to use it for soldering to the metallized ceramic terminal strips used in those old models, otherwise the metallization would disappear after a couple of rounds of soldering.

It's not necessary to use this solder for solder-terminated surface mount components intended for mounting on circuit boards.

Homebrew

Hi all,

It has been a few weeks since I posted anything to the group, but in case you do not know, I have put a few circuits on my homepage. The latest was the G8TGL Terminal Unit which was originally designed to power an old teleprinter. It worked well on the HF bands although it needed a good filter (or a strong RTTY signal).

There have been loads of comments about the transmitters, but surprisingly, the BUG FM transmitter is still the most popular of the circuits!! Isn't it funny how amateurs like to play!!

I am still working on my all valve General Coverage receiver but the last two bands are a bit slow. I have been abroad a couple of times and don't seem to have much time.

Anyway, the URL (the new abbreviated URL) is:

http://come.to/sm0vpo

It is easier to pronounce on HF SSB.

Hope you have some fun with my circuits. Best regards and Merry Christmas. Regards Harry, SM0VPO (ex G4VVJ / G8TGL)

In addition to all that, silver solder also provides
a much more rigid mechanical joint. This is useful in
some applications.

The significantly higher melting point of silver solder is a non-issue
for electronic use, because all your active and passive devices
will degrade or die well before the melting point of Tin-Lead
solder is reached.

I don't have any experience with that radio, but that problem
is very characteristic of a lot of Radio Shack radios. I know
their 2m/440 handheld ham radios have the same problem,
dead audio for a good 1/2 sec after you release the PTT.
Chances are, there's nothing you can do about it. It
doesn't sound defective to me, it just sounds like a RS rig.

Farnell offer several germanium diodes, including several varieties of
OA90, AAZ15 and AAZ17, also Schottky bridges and general-purpose PIN
diodes from HP. The bridges are said to go to 2 GHz.

This sounds like the radio has the AGC or QSK adjustments set too slow.
This is exactly what my Ten Tec does when I select the slow AGC or QSK
settings. If you cannot find an adjustment you will need to contact Rat
Shack and have them adjust it for you.

: They call me "Crash" because that's the only way I can get into parties.

It's like the advantages of a tack hammer compared to a sledge hammer;
depends on what you're doing.

Silver solder is higher temperature, mechanically stronger, and doesn't
leach lead.

In electronic assembly, about the only place silver solder is appropriate
is in soldering to metalized ceramics; the metalization is typically
silver based (though other metals are used) and lead solders tend to
leach the metalization off the ceramic.

The old Tektronics oscilloscopes with the components mounted on ceramic
carriers instead of circuit boards came from the factory with a small
spool of silver solder inside for makeing repairs. It helped keep people
from wiping out the carriers when they replaced a component.

When used on circuit boards, the high temperature of silver solder tends
to cause the pads to lift; not an appropriate use.

It's good for mechanical assembly. I had a radiator in a car once that
wouldn't stay together until I silver soldered all the joints. Kinda
pricy, but cheaper than a new radiator.

Article Reprint from August 97 Monitoring Times Page 72
"The World of Ham Radio"
A Gem of a CD
Ike Kerschner, N3IK

Have you ever stumbled onto something truly valuable? Remember the surprise, the thrill? You can experience that same feeling when you examine a copy of the CD-ROM software by AMSOFT called "The World of Ham Radio"! This is one of the best bargains I have laid my hands on in a long time.

This CD has been around for a few years, and I have seen it for sale at several hamfests. Several years ago I looked at it and felt the CD provided a decent call book with some nice software.

The latest copy, however, knocked me over! I held a copy of it for several weeks before giving it the once over, but after I started I couldn't stop. Programs that I had on separate disks were available to me in one location with an excellent menu, and moreover, they would run directly from the CD. For many years I have collected shareware at the price of 2 to 6 bucks a disk, finding many I liked but a lot more that were just ho-bum. If I were to add up the cash laid out to come up with a handful of decent programs I am sure it would be several hundred dollars.

"The World of Harm Radio" is a collection of excellent software, in fact, almost all of the programs I have chosen over the years as being the best are on this CD, plus a lot more, to boot. All of this and a call book, too! Looking up a call is a snap in AMSOFT's "World of Ham Radio." But, let me give you a brief tour of what else is on this CD.

When you type CDVIEW, a listing of many different subjects is presented to you. Choose "Antennas," for example, and you will find 26 different antenna programs that will provide full information on a host of antennas, from simple long wires to yagi and complex loop antennas.

"Basic programs" are a wide range of simple programs written in BASIC which will run directly from the CD. Examples of the Basic listings vary from antennas to z calculations.

Twenty-six different programs deal with Morse code - from learning programs to programs that will allow you to send Morse from your computer keyboard as well as copy code via the computer and shack receiver.

A variety of engineering programs are included, among which are a a simple-to-use CAD program for drawing schematics, a program to lay out PC boards, and tools for designing specific circuits.

Eight different logging programs give you anything you want for contest logging, general logging, and certificate hunting.

One program I particularly like is a training manual for the oscilloscope. As you go through the Oscope manual the computer shows demonstrations of what will appear on the screen of your oscilloscope under different testing situations. Last Christmas a good friend wanted more info on using an oscilloscope and we spent several weekends going over the use of the instrument in my shack. If we had this program, I am sure my friend would have learned a lot more a lot faster.

Equipment modifications also are included on the "World of Ham Radio" CD. I examined all of the mods available on the CD and am anxious to try several, especially one for a scanner I have. Not every piece of equipment is covered, but there is a lot!

Eight propagation programs allow user to determine the best time and frequency to work various parts of the world.

Included are 36 packet programs from very simple to very elaborate terminal programs, information on using packet, and circuits for various packet projects. If you ever wanted to try RTTY, 10 programs on this CD will let you get your feet wet in this interesting mode with minimum outlay.

A very interesting listing for satellite comm- unications provides info on operating and tracking programs, again from simple to fairly complex. There are several programs for SSTV and WEFAX that I am just now beginning to explore.

As always, there is a "Miscellaneous" listing containing 89 programs which I have only begun to explore. There is also a question and answer section that deals with many subjects, Scanner buffs and SWLs will find a lot of good information on this CD: frequency lists, data bases, modifications, and more.

In short, "The World of Ham Radio" gives you hundreds,
if not thousands of dollars worth of information on ham radio,
and all at a price of $29! If you have a CD drive on your
computer, grab a copy ASAP. If you don't have a drive,
consider putting one on your machine just so you can
use this super CD.

I think that you will have problems getting 20 dB in a single stage. The
RSGB Microwave Handbook Vol. 3 has a high-performance, low-noise 1.3 GHz
GaAs pre-amp. which you could probably adapt for 1.5 GHz.

# 5162. need tube info

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-11 00:00:00 UTC
From: David Hatch <hatch_david@u2.bbrown.com>
Message-ID: <349037E4.4971@u2.bbrown.com>
Source record: 88448

Greetings,
I recently acquired a pair of tube audio amplifiers. No particular markings, except for the power xfmr, so I found AC power in easy enough(!). The output xfmr was also a no-brainer. They at least somewhat work. There is a gain pot on the input, and I can inc/dec to get varying levels of hum. But when I hook up my sig. gen to the input, there is *much* more hum than signal. They're fairly simple; 2 stages of 12AX7's and a 6AQ5A, with a 6X4 for HV rectification. The output xfmr is a Triad S-53X Universal. 6 output lugs, but not labeled for any particular impedance. There is also a can about 1 1/2" dia x 3" tall, labeled James C-1800 6 volt 60 cps. On one amp it is very noisy. The other is quiet. No idea what it is. What I would like is if anyone could direct me a bit as to what to look for signal-wise. I don't have much tube background, so maybe a book or two to look up? If someone wants to go more in-depth, I could probably come up with a schematic in .bmp by next Monday.

Thx, 73's
David

# 5163. Re: silver-bearing solder

>In addition to all that, silver solder also provides
>a much more rigid mechanical joint. This is useful in
>some applications.

You're confusing this solder (with 2% silver content) with "silver solder", which is a hard solder having a much higher silver content and, I believe, made from metals other than tin and lead. Eutectic tin-lead solder (Sn/Pb 63/37) melts at 183 C; 2%-silver solder (Sn/Pb/Ag 62/37/2) solidifies at 179 C and liquifies at 189 C. (The solder is in a "plastic" state in between; the eutectic 63/37 alloy doesn't exhibit this state.) So the melting temperature isn't changed much by the 2% silver content. Neither are the mechanical properties, except that you have to be more careful not to move the component as the solder cools due to the existence of the plastic state.

>The significantly higher melting point of silver solder is a non-issue
>for electronic use, because all your active and passive devices
>will degrade or die well before the melting point of Tin-Lead
>solder is reached.
>
>N6OTQ

Modern active and passive devices will withstand the melting temperature of tin-lead solder; the temperature of many components reaches this temperature during soldering, and some surface-mount processes actually immerse the components in a bath of liquid solder.

You might take a look at "A Simple and Accurate QRP Directional Wattmeter", QST, February 1990, p. 19, and "The Tandem Match -- An Accurate Directional Wattmeter", QST, January 1987, p. 18. They describe a novel method of detecting low-level RF. The former article uses 1N34A diodes. The prototype unit functioned well up to 450 MHz, but I later found some diodes which wouldn't operate well above about 2 meters. The second article uses hot-carrier diodes which are more consistent at higher frequencies. The technique could be adapted to silicon junction diodes like the 1N4148.

Thanks!

Roy Lewallen, W7EL

Dear Sir:

The Agusan Radio Club Incorporated of Butuan City, Philippines has bought a Repeater Controller made by Advanced Computer Controls Inc. of the United States. We tried to contact the manufacturer because we had some problems with it but unfortunately, the no. in their manual now belongs to another company ansd we do not know how to contact this company.

We read your email address in the CQ Magazine and would like to ask you a favour if you cna help us locate this company and give us their complete address with their respective phone numbers. Any assistance would be highly appreciated by all our club members.

Thank you for your kind attention and may we look forward to hearing your good news.

The Mini-Circuits MAR-6 is specified as having 11.0 dB gain at 2 GHz, 16.0 dB at 1.0 GHz., and a 3.0 dB noise figure (all typical). The MAR-8 is specified at 22.5 dB gain at 1 GHz, 3.3 dB noise figure, and a lot greater dynamic range. Prices are a few dollars, and both require only three or four external components. (But you'll have to add input filtering to keep them from overloading and creating spurs from out-of-band signals.) You can contact the Mini-Circuits distribution center at 800-654-7949, or see your favorite supplier.

Look for the KA9Q software, it's free. The latest version source code
needs the current DJGPP DOS port of gcc for compilation.

No squelch, I'm in the habit of leaving it all the way open. (sidebander habit, I guess) I think the problem is in the tx/rx switching, but I'm not 'up' on that circuit. I note that there's no relay in these modern rigs---!? so must be switched by trx or diode?

Jim, you are confusing "hard" solder with 2% silver solder. 2% silver
solder is not high temperature (solidus point is within 2 degrees of
eutectic lead/tin), and it is not high strength (yield point is also within
2% of lead/tin). It does prevent leaching of nickel, silver, or gold from
components, and that's why it is used.

"Hard" silver solders, used by jewelers, gunsmiths, etc, have a silver
content of 50% or more. They are more correctly considered brazing alloys
rather than solders (solidus point is 1400-1700 F depending on the particular
alloy composition). They are best applied using a torch, and they have
a high strength (70,000 PSI), but they find no use in electronic assembly.

I need someone experienced in working on older receivers to repair and allign my old HRO 50-T1. It needs a power transformer (I have one that I think will work), and I would like it tuned up and working well, recapped if needed, etc. It's well beyond my capabilities to do a good job on it. Prefer someone reliable anywhere around the Austin area. Reasonable pay is no problem. WB5JEO Lockhart

HI
Looking for an IF unit HP 8552A or B (preferred) and a RF unit HP
8554. They are needed to get my HP 141T spectrum analyzer going! I am
willing to pay a fair price.....

Both working or non-working units!

# 5182. CQ QRP Ops: Why Isn't There More 30 Meter Activity?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-12 00:00:00 UTC
From: cliffkot@interaccess.com
Message-ID: <cliffkot.235.00625206@interaccess.com>
Source record: 88377

Hi Guys,

During the past couple of months I've been reading everything I can about QRP design with the idea of building a small single bander for camping. The big question is always -- what band?

A survey of the construction literature seems to indicate that the most popular bands are 40 or 20 meters and my listening confirms this finding. It seems to me however that 30 meters would be a more suitable QRP band.

On the average I would think that propagation conditions would allow a longer daily period of operation on 30 meters than either 40 or 20. Also, power on this band is limited so the competition would be only 10 to 15 db louder causing less QRM, so the simple NE602 mixers you all seem to be using would do an adequet job without overload.

The big question is why isn't there more 30 meter activity?

ultrasonics are OK for communications, but problematic
for data - too much reflection. Plus it only needs to go
about four feet (through flesh and bone). There are SCUBA
computers that do this (using RF).
A small (1x1") unit transmits tank pressure to a wrist
mounted computer using digital signals. They're even
digitally "keyed" so two divers won't cross signals if they
are within th four or five foot transmission zone.

Frequency and antenna configuration on these things have
me mystified.

-Will

This is another case of Radio Shack doing something right, and catching hell for it. On the VHF/UHF handhelds, the radio is dropping the CTCSS tone before the RF drops out. Thats why you don't hear the squelch tail on the end of a transmission from a RS HT.

Hi,

You may want to try this with a schottky diode:

```
------1nF---| -diode-|-----|------+out
RF in | | | to Fluke 8020B
BNC 51R 1000pF 1M
------------|--------|-----|-------gnd
```

If you don't want to do surface mount,
try the 5082-3080 by hp.

The surface mounts can be had for 50
cents each in small quantity.

Best, Dan.

Hi fellow Hamcomm people.

Just wondering if anyone has any interest in setting up some AMTOR contacts. OK, ok, so AMTOR is old hat, but if you have Hamcomm (which is a great deal, by the way), that is your only choice other than straight RTTY.

If there is enough interest, I'd wouldn't mind putting some space on my web site to help people set up AMTOR QSO's. Maybe a call, a time you will be on, and a Freq. something like that.

Email me if you are interested and I will set something up.

There are problems with audio: reflection and absorbtion cause
signal distortion. More importantly, there will be several
devices in the water at once, and one of the advantages
of radio is that there is a very definite travel distance.

This isn't new: there are computers for SCUBA diving that
transmit tank pressure to the wrist-mounted computer via
radio. Each unit has a binary serial number that
identifies it as being unique, rather than frequency
separation.

Yes, you are correct there are no relays anymore for that purpose. All switching is done via a transistor. Someone on the NG mentioned the ALC on the front end being abnormally slow for some reason. I agree that would cause this symptom. Maybe some investigation in this area would be in order...

Look in the ARRL Handbook. You will find suitable single transistor
circuits for both low and high Z mics.

# 5208. ICOM R71A power supply fix

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-13 00:00:00 UTC
From: pierfelice <pierfelice@NoToSpam.MCI2000.com>
Message-ID: <01bd0764$ed2e4b00$LocalHost@default>
Source record: 88394
Cross-posted to:
rec.ham-radio,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.shortwave

My R71A had power supply trouble as many have had or will. The design of
the supply results in poor regulation and AC ripple on the supply output.
My solution was replacing the active components with one ECG1954 low
dropout 12 Volt 1Amp 3 terminal regulator. The ECG1954 requires but 13
Volts at it's input to function unlike other 3 terminal regulators that
require about 16 Volts (such as the 7812). The ECG1954 is a TO220 case as
was the original pass transistor Q1. Cost of the ECG1954 was $5.
Basic steps I performed:
1) Remove the regulator unit from the radio.
2) Remove the PC board / transformer from the regulator unit frame.
3) Remove everything on the PC board except
C11,L1,F4,D1,C3,C4,C5,C6,C7,C9,T1
4) Install the ECG1954 where Q1 used to reside. Note that the mica
insulator is no longer necessary on the heat sink and can be removed for
improved heat transfer.
5) You will have to jumper the input and output pins of the ECG1954
appropriately. Add a jumper from the cold end of the fuse to the ECG1954
input. Jumper from the ground side of C7 to the ECG1954 ground pin and
jumper the ECG1954 output to the radio's DC input. I removed J2/P2 from my
radio.
6) I also glued a rubber grommet on top of T1 to contact the bottom cover
and reduce vibration induced in the cover from T1's field.
7) Put the radio back together.
Note that this fix may not work with other than "bare bones" R71's. Mine
does not have the crystal heater, FM, remote or any other option. The radio
uses almost 1 amp as is and radios with more options may require a second
regulator.
How does it work? Great! Even though the radio was designed to run at 13.6
Volts, mine runs fine at 12. No hum and stable down to 105 Volts line. I
also installed an International Radio (WWW.QTH.COM/INRAD) Fox-Tango CW
filter at the time of this modification and I am very happy with the
filter's performance.

## 5209. crystal filters

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-13 00:00:00 UTC
From: msebrakr@telepath.COM
Message-ID: <3.0.1.16.19971212204421.3fef3986@telepath.com>
Source record: 88395

I have an old Galexy V ham radio. It's IF filters is at 9 MHZ with a bandwidth of 2.4 KHZ. The filter is a black box with an input, an output, and a ground. I want to if I can make another filter, like a crystal ladder filter, with a tighter bandwidth, say 500 Hz, and then add a switch so I can switch between it and the other filter. If you could provide me with a filter schamatic and/or suggested I would greatly appriceate it. TNX.

73,
Arnold KD5CKH

>parallel to increase that, true?
>
>DJ

That's right. Things to remember:

Emitter resistors to balance the load between transistors. Something
around .1 ohm.

Use too many transistors instead of too few. 2N3055's are cheap.
With power supplies it never pays to "live on the edge."

There is a voltage drop across the transistors, so output voltage with
a 7805 will be around 4.2-4.3 volts. Use a LM-317 adjustable regulator
to get a 5 volt final output.

Don't forget to bypass the output of the IC regulator and the final
output or it will oscillate. Use tantalum capacitors if possible.

Check your local public library for an ARRL Handbook. The power
supply and power supply project sections. You will find an example of
power transistors in parallel.

Power supplies are great projects. I built a 12 volt supply that's
good for about 50 amps. Great educational experience, especially when
it started oscillating and generating RF noise... (Bypass caps fixed
that one.)

Hi,

I know these parts I search are not radio related, but being known as a 'ham' I get all the family repair jobs chucked at me..

Anyway, I've been given this touch on/touch off 240V light. There's only two parts that could be dud, both of which are naturally not in RS, Farnell etc.

A C026, a triac I believe and a 8 pin DIL IC: LS7232

I can probably work out the pin out for the triac and hence an equivilent, but anyone know the IC ???

thanks.

Hi Mike,

sorry, I haven't seen such a circuit although nearly all the authors mentioned that their spectrum analyzer circuit can be extended to at least several GHz. But none of them said how this can be done exactly......

Best regards

Peter

Buy Haywards book "Introduction to RF Design" from the ARRL and read it. His design software will design the filter (and many others) for you.

Source record: 88411

If you're 'beefing up' an existing PSU you'd of course need a new
transformer to deliver those amps - so you've effectively built a new PSU.
Better really to do just that!

I think also, a few caps to dampen parasitic oscillations, especially if
there's going to be RF about? A 50-amp PSU oscillating could be fun!!

If a fixed +5v is what you're after, there are plenty of cheap switched-mode
PSU's about nowadays at rallies etc. Unless of course you want a linear
supply for being (electrically) quiet. I can't imagine why though, because
+5v @ lotsa amps suggests loads of noise-making digital chips!

>Is anyone else using it?

Not sure what you are planning on doing with it, there are several packages out there that have different strengths and weak points.

You might write to Bob Stanton, RF Engineering, Rd1 Box 587 Norwich, NY 13815

He wrote one called NOVA, quite like PSpice but with real time tweaking of component capabilities while you watch the Bode response. I find it just about all I need. It was originally $75, but about a year ago, he made it Public Domain and encouraged giving it away since he had started on a (Yech) windows version.

Of course, the student version of PSpice is also available for free, between these two, I find I don't really need anything else.

---

30 is an interesting band in terms of propagation, but it closes sooner than 40 in the evening and has higher absorption than 20 during the day. It is at it's best just before 20 opens or just after 20 closes, but the time period there is short. Once 20 is open, it's better. Once 40 is open, it's better too.

I always thought 30 would be an ideal band for mobile operation. The antenna would be more efficient than an equal-length 40 meter one, and propagation would be somewhat longer during daytime hours (though not as good as 20). If they ever allow SSB there I think it would become very popular.

73, Bill W7TI

You may check at your Radio Shack for a book on how to become a ham. Technician No-Code Plus is one for $12 that should give you a good idea of what is involved.

Depending on what type of radio you want, there are usually some bargains at ham swapfests (like a ham garage sale). Two meter radios for local contacts are generally about $400 new and used ones come down to about $100. High Frequency radio transceivers start at about $800 new, but you can get a good used one for as cheap as $300. Antennas, like radios, have a wide range of cost. You can expect about $50 for a mobile antenna and about $75 for a base station antenna. HF antennas vary from simple wire antennas that may cost you only $25 to beams that cost much more. Two meter antennas don't have to be put up very high if you live in a city with repeaters. In general new hams spend around $500 before they feel like they have anything to operate with. Hams that have been into the hobby for several years may have thousands of dollars worth of equipment. We all start out rather modesty, so don't be discouraged.

If you plan to get into ham radio, get you a book and read a little and also try to meet some local ham operators. There may be a ham club nearby also. It is a good hobby. Good Luck.

>I am thinking about buying the Radio Designer product.
>Is anyone else using it?

I've got it. It is Ok for simulating passive networks and Class A linear circuits. It doesn't understand biasing, and has no concept of any nonlinear circuit like a mixer or an oscillator or a Class C amp. For that you want Spice or NOVA or one of the other modeling programs which understand biasing and non-linear behavior. It is also just a circuit simulator. It isn't really a design aid. By that I mean it won't calculate component values for a filter or anything like that. There are a number of programs which will, some of them free.

What Radio Designer does, it does quite well. But it doesn't do a lot. Get MicroSim's free demo CD for DesignLab and you may find that it does everything you need (the demo is limited to 30 components, but otherwise is their full product including schematic capture, board layout, auto-router, Spice simulator with simulated scope probes, and it does digital as well as analog, including programable gate arrays). If DesignLab can't do it, you probably don't need it. If the demo version's 30 component limit is too constraining, spring the $13,000 for the real thing.

I find that 30 components is enough for most circuit modules, so I use their demo almost exclusively. I'd pay at least as much as I paid for Radio Designer to up the limit to 100 components, but there's no way I'm forking over $13,000. (They offer a student deal for $1,300, but that's still a little bit too steep for me.)

The Smith Chart is just a complex transform of the impedance plane.

Consider an impedance Z=R+jX, where R>=0 and X can have any real value, i.e. any electrical impedance. Normalize the impedance to the impedance of a transmission line Ro. Let z=Z/Ro, the normalized impedance.

Now consider the function f(z)=(z-1)/(z+1). Any impedance as defined above will plot on or inside a unit circle. Consider the case Z=Ro. Then z=1 and f(z)=0+j0. This is the origin of the complex plane (Real part = 0, imaginary part= 0.) An open circuit Z=<infinity>, then f(z)=+1,j0. This is the right hand limit of the impedance normalized Smith Chart. Consider Z=0. Then f(z)=-1, the left hand side. Now take Z=jRo. Then z=j and f(z)=(j-1)/(j+1).If you multiply this by (j-1)/(j-1) the denominator becomes -2 and the numerator works out to be -2j, so the ratio is j, or more properly 0+j, which is the top of the Smith Chart. Similarly if Z=-jRo, f(z)=-j. For all pure imaginary z, f(z) is on the unit circle. If there is any resistive(real) component, f(z) will be inside the circle. You can thus plot any impedance on the Smith Chart.

The beauty of the Smith Chart is that a section of transmission line of impedance Ro added between the generator and the impedance Z transforms the impedance in such a way that the new load impedance,measured at the generator can be determined by rotating the original z about the origin through an angle equal to twice the electrical length of the transmission line section.

I have also used the Smith chart to plot the gain response of an op amp. The utility of this is that any op amp with a single pole plots on the same curve, indpendently of the frequency of the pole. There are always 2nd, 3rd and higher poles in real op amps. The distortion of the curve from the higherpoles can plainly be sen in this plot, where it is subtle, like a change in slope, on a normal phase and amplitude gain plot.

Note that the Smith Chart only represents the right half complex impedance plane. It takes another circle to represent the negative

half plane. This of course doesn't apply to normal transmission line problems.

The traditional use of the Smith Chart is as a graphical means to obtain the length of transmission lines and lumped impedance necessary for impedance matching.

Don't know if that helps, but it has nothing to do with calculus, just complex algebra.

I believe you are referring to LaPlace Transformations where s-domain is
frequency as opposed to time. There are many manipulations that can be
performed and you can also take inverse LaPlace Transforms to put things
back into time domain. unfortunately there is no easy answer, since it
really depends upon the equation.

This is a fairly involved subject which is usually covered in Circuit
Analysis Textbooks.

Hi Jan-Martin,

I have experimented with a broadband RF power meter and found that schottky diodes are sensitive and work well beyond 1 GHz. E.g. the types BAT 64-07, BAT 62-03 W, BAT 63 and BAT 17. If the levels to be detected aren't too low, the HP 2800 Series might be choice.

All the diodes mentioned are available(also in small quantities) from RS Components (http://www.rs-components.com).

"minilinx" <minilinx@netaccess.co.nz> wrote:

>Hi,
>Could someone please email me formulae for converting
>S-Parameters into Input and Output Impedance.

The detailed formulation can be found in the Radio Engineering Handbook and probably many others as well. I don't have that handy, but I can tell you enough to figure it out for yourself.

The s parameters relate the reflected (outgoing) waves at all ports to the incident waves at all ports. Generall a is used for incident wave and b for reflected. For a twoport network you get:

```
| b1 | | s11 s12 | | a1 |
| | = | | | |
| b2 | | s21 s22 | | a2 |
```

There are some rules relating the parameters, depending on whether or not the network is passive, reciprocal, etc.

Now you can relate the voltage and current (V, I)at a terminall to the wave amplitudes a and b in the following way:

a = (V/SQRT(R0) + I*SQRT(R0))/SQRT(2)

b = (V/SQRT(R0) - I*SQRT(R0))/SQRT(2)

R0 is the characteristicimpedance of the transmission line.

The impedance at the terminal (looking in) is V/I.

For a two-port network, of course, you get a 2 by 2 impedance matrrix.

The algebra is tedious, but that's what is required to get the answer yoiu seek. Unless you look it up in a book.:-) :-)

Note that the current calculated is the current into the terminal which is what you want for an impedance matrix. For chain matrices, the current on the output port(s) is defined as coming out of the terminal.

Help!

IC chips needed for my only oven time base bench counter, Western Electric Model KS 20884: MC1662L & MC1678L. Does anyone know of a source for these? Does anyone know what they are, have pin outs or data on these? I know that the MC1662L is faulty for sure.

I don't have any info. on these IC chips. They do operate at TTL levels. Also, I don't have a manual for the counter. What a predicament!

Is it junk, or is it not. That is the million dollar question.

Thanks, Byron

Well, which edition? There are 75 of them now.

Admittedly, solid-state info really didn't start showing up until
1960, and you probably wouldn't want to go back more than 20 years
because you can't buy the parts.

But my 1997 handbook shows only IC-based mic amps and speech
processors (page 17.45). Of course, these would likely
be a LOT better than a one-transistor design.

Please, when you ref the handbook, give us a clue about what year,
and if possible, what page. The Index and the Table of Contents
have never been a strong suit in the handbook. And since back before
they invented fire, the handbook has always had wonderful pieces
of totally essential information tucked in the wrong place, without
an index reference. Such as the WONDERFUL tip that you can use
1/2" copper pipe for a station ground (page 9.8, figure 9.6,
1997 edition). This isn't well-indexed and appears (AFAIK) only
once, in the Safety chapter but not in the Station Setup chapter.

So give us a hint....

Jim N6OTQ
pleasantly surprised at how much the handbook has been improved
in the last few years

[snip]

Actually, using the circuit optimizer, it will calculate component
values for a filter, matching network, etc.

You must decide on the topology and put realizable limits on the
beginning component values, but then after defining the desired
outcome, you can just say sic'em and let the optimizer do the work.

I don't have the pinouts, but in a 1973 Motorola reference volume, these
are listed.

MC1662 quad 2-input nor gate
MC1678 bi-quinary counter (350MHz typical masimum operating frequency)

And they are ECL, in Motorola's MECL family.

Jim Potter already gave you the fundamentals on this.
I will just add this:

Suppose you wanted to represent ALL POSSIBLE impedances
R+jX

R >= 0 to infinite
and X from - infinite to +infinite

You will have a problem and couldn't fit that on a piece
of paper. The Smith Chart is just another representation
of the right half side of the rectangular plane in a
circle using the Z transform explained by Jim Potter.

Now you can put 0+j0 but also 10000 -j10000 and also
10000 + j2000. On top of that you have a set of
"magical" properties like rotations, reflections etc
that will represent addition of R, X, admittances
transmission lines etc...

The ARRL antenna handbook has a section at the end
explaining the Smith Chart and how to use it. It is
a great tool for matching impedances, coax Xforms
and a lot of other things....

There is no doubt that Pactor is more popular. There is also little doubt that Pactor is "better". The issue is that HAMCOM doesn't do PACTOR. Some of us still like to build what we can.

Lord knows I don't want to start a flame war about how awful AMTOR is. It is better than RTTY and for HAMCOM users thats your 2 choices.

# 5267. Re: How to make simple hi-pass filter?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-14 00:00:00 UTC
From: Al Williams <alw@al-williams.com>
Message-ID: <O5tLJOPC9GA.246@ntdwwaaw.compuserve.com>
Source record: 88355
Cross-posted to: sci.electronics.design,sci.electronics.misc,rec.radio.amateur.homebrew,sci.electronics.basics

The really low parts count classic hi pass filter is just a capacitor in series with the input and a resistor shunt to ground.

```
In -----C----- Out
^
R
|
Gnd
```

The idea is to make a voltage divider that is frequency dependant. Say XC is the reactive capacitance of the capacitor at some frequency and R is the resistance of the resistor. Then (given infinite source and load resistance):

Vout=Vin R/(XC+R), so as XC goes down towards zero, this gets closer and closer to R/(0+R)=1. Right? as XC goes up, the fraction R/(XC+R) gets very small.

For any capacitor, XC is going to go down as frequency increases. Why?
XC=1/(2piFC)
So all other things being equal XC is inversely proportional to the frequency.

Now, your scope has some impedance (probably very large) that has to be factored in. And the source does too.

Say you want a 50 ohm R and you want the signal to be 10% at 50khz. A little back of the envelope says that C should equal .007 uF.

At 50khz, the XC is 450 ohms, and 50/(450+50) is .1. Now .007uF caps aren't very common, but .01s are. Let's see:
XC@50kHz=318 ohms
so at 50kHZ your divider fraction is .14, which is probably OK.

At 30khz the fraction is even less (about .09; less than 10%). at 600khz (your lowest freq. of interest the fraction is about 65%. Of course, you have to factor this filter attenuation into your measurements.

Not sure if that will help you make your measurements, but hopefully it helps you with simple filter design. By the way, want a low pass filter? swap the R and the C. That reverses the voltage divider. Same principle. Voltage dividers are the most important building block in electronics, in my opinion. Explains the wheatstone bridge, transistor and tube biasing, RC filters, and plenty more.

If you want to learn more about stuff like this, drop by web site and see the review on the Art of Electronics. Absolutely the best book of its kind bar NONE.

Message-ID: <349482B1.6AD963C2@rasdoc.com>
Source record: 88356

I am working on a I/Q direct conversion reciever for the ~300Khz

Coast Guard DGPS broadcasts.
Since I am doing an I/Q direct conversion reciever, and I was
cotemplating using a pair of NE602's for the mixers....
I need to know how the NE602 does converting to DC.
Does the DC setpoint drift?
At about what rate? .1Hz 1Hz? 10 Hz?
What is the common mode value of the outputs?

None of this appears to be covered in the Datasheet.

Paul

>Could someone please email me formulae for converting
>S-Parameters into Input and Output Impedance.
>
>Regards
>Dave Huisman
>
Hi dave. here are equations to convert from scattering parameters (s
parameters) to impedance parameters. I assume you mean a 2 port network.

Zi=((1+S11)(1-S22)+S12 S21)/((1-S11)(1-S22)-S12 S21)
Zr=2 S12\((1-S11)(1-S22)-S12 S21)
Zf=2 S21/((1-S11)(1-S22)-S12 S21)
Zo=((1-S11)(1+S22)+S12 S21)/((1-S11)(1-S22)-S12 S21)

In these transformations, S in a scattering coefficient, Z is an impedance
coefficient, and all numerics should be regarded as subscripts.
Hope this helps

Don

I am using =Superstar= from Eagleware, it used to have the same tideous circuit description input as Radio Desiner but have now moved into schematic input. Both Radio Designer and Superstar are linear analyzers i.e. much faster at analyzing circuits than any spice based product. The price-tag for Superstar is $995 as a starter (you would really want some extra add-on programs) , which is *very fair* but expensive for hobby use only!

Using Superstar at work with all the add-on programs for designing microwave filters, active filters PCBs etc makes you very very spoiled!! I really WISH that they could release a "light version" for experimenting HAMs

I find the tuning option very enlightning, especially tweking filters and changing Q-values. Using realisitc Q-values gives invaluable insight to how lossy the filter will be.

Using high performance simulation and design software are fun to say the least, and it is a pity they are so expensive it is almost impossible for the experimenting ham to use this stuff. If only the software companies would understand that letting hams using it in their hobby would surely boost the proffesional usage too i.e. increasing their revenues.

As things are now, I recommend go for RF-designer and have fun but as always: If one start with a shitty desing the result is usually poor.....

Speaking of S parameters, has anyone tried building their own network analyzer for low frequencies? It shouldn't be too hard: feed a VFO into the device under test through a programmable attenuator, receive it back with an agc amp. The agc voltage/attenuator setting is magnitude. Feed both the original VFO and the received signal through limiters and to a xor-gate or flip-flop phase detector and low pass filter to measure phase. Maybe have A/D converters and control everything with a PC.

Did you say to look in the book "introduction radio frequency design" or "solid state design for the radio amateur" about crystal filters?. Sorry for making you repeat youself but that message got deleted.

73,
Arnold KD5CKH

P.S. Anybody else out there with suggestions for a 9 MHZ I.F. low BW filter for CW?

I don't think this is either helpful or correct. The "s" in
S-parametersstands for "scattering" and has nothing to do with the s-domain.

The Philips RF wideband transistor data-book SC-14 describes
S-parameters as return losses or reflection coefficients of a
two-port network.

Neither of my microwave texts is very helpful on how you
would transform the s-parameter matrix to the impedance
matrix, so I can't answer the original question, but there
ought to be a microwave text that makes this simple.

Every time I have done business with Dan's I have been more than satisfied. Great deals. Have bought some stuff on reel strips with no worries. Don't know what passes for "real low price" but I've bought plenty of caps there too. No experience with the 10T pots, but FWIW, I really like doing business with Dan's.

Now if he would let you order online.... oh well, can't have everything.

Regards,

Al Williams WD5GNR

If you knew enough electronics to appreciate a useful response, you wouldn't have posted such a trivial question. Find a library and look up the answer in an
electronics text - we like "The Art of Electronics" by Horowitz and Hill - ISBN 0-521-37095-7 but it was written as an undergraduate text for use at Harvard, so you may want to look out for something by Don Lancaster.

>Bert Douglas.

Bert, it takes some time to learn the smith chart and you really need to read all you can and then get someone to sit down with you and go through some excercises. It really isnt as bad as it looks, but its one of those things you have to actually do, kind of like soldering. If you can get a copy of the following book from a library, you will find it very well written and straightforward, yet not compromised by simplifications. Contrary to the title, it is mostly for smith chart. I dont reccomend it for antenna or field theory.

>

Alan - it should work OK. I have built a transverter that converts
144-148 MHz to 3.5-7.5 MHz, thus allowing both 80 & 40m from a 2m
multimode rig.

Start with the local oscillator - you will need an xtal oscillator on
144-26 MHz if you want to cover the CB band as well. This could be done
with 2 transistors - an overtone xtal oscillator and doubler/tripler.
Then build RX mixer part, then TX section. It is desirable you have
access to the PTT line of the 2m rig (the FT290R has a socket on the side
for this) to switch the transverter.

The hardware is trivial - just about any of the DSP chip evaluation boards will do the job. You might want to try transmitting first, as the input signals are more controlled, so dynamic range isn't as tough a problem as it is on receive.

You still need software to make it go. Look in your favourite DSP reference under "Hilbert Transform".

Yes, that's the sort of expression that I vaguely remembered - not so
dreadfully complicated in that form. You only have to evaluate the
denominator once, of course, and in some cases one or more S is
negligible or, for a passive network, S12 = S21, of course (IIRC).

Just to clarify, I suppose Zr is the reverse transfer impedance and Zf
is the forward transfer impedance?

>
> Regards
> Dave Huisman

Briefly, the input impedance, assuming the output is
termianted, is 50*(1 + s11)/(1 - s11). That's also assuming
the parameters were measured in a 50 ohm environment
(which is almost always the case). Likewise, the
output impeadance, assuing the intput is terminated
is 50*(1 + s22)/(1 - s22). But the intput and output
are never perfectly terminated and that means that
the actual impedance a the output will affect the
input impedance and vice versa. That's where the
s12 and s21 termns come in. (See Jim Potter's
post for more on that.) That's all the free
advice I am good for at the moment. If you really
want to design a high frequency you need to read a
good book on high frequency amplifiers. The one by
Carson is is OK.

The roll of for an RC filter will be 6dB / ocatve.
The 3 dB point would be f = 1 / R x C.
If you look at a 60 Hz ripple on 30 KHz, then start rolling of at 100Hz,
200 -6, 400 -12, 800 -18 etc.
Should do the job.
Any errors are copyright J.M.

>> The 3 dB point would be f = 1 / R x C.

Hi,
IMHO the equation should be as follows: f = 1 / 2 x pi x R x C

CU, Reinhard

## 5302. Herring Aid Receiver

Newsgroup: rec.radio.amateur.homebrew

Hi,
No, I am wanting to perform impedance matching between RF stages.
The transistor data is only given as S-parameters (s11,s12,s21,s22).
S11 relates to reflected wave at input while s22 refers to reflected
wave at output (as response to incident wave from a signal generator).
There should be a formula which will allow the input reflection co-efficient
to be converted to input impedance.

Hi agn Peter!
Yes, I will look for data and prices for the diodes you mention, and the 1N5711 and 1N6263. We need diodes for another project, too. My friend Wilhelm Sch&#65533;rings DK4TJ described a circuit using a/d converter with minimum detectable level of -30dBm. We are planning to build something better. My plan is to make a voltmeter with lowest range of 10mV and max range of 10V RMS, so it would be best if we could buy only one type of diodes, they must stand at least 30V peak. So perhaps we may have it demonstrated sometime at Weinheim VHF meeting..... This instrument should be a modern version of the LA7MI type I described in DUBUS Magazine in 1986 years ago (using diode/resistor combinations as gain equalizers)

1) It is important to build 5 equal detectors, so we will not have to calibrate output voltages for each detector and make special measurements to calibrate them.
2) Frequency charachteristique should be as good as possible, I don't want a gain vs frequency correction factor.

I did not have success with the RS homepage, but I have updated catalog at work, I have also CD for RS and several other manufacturers, the only problem is that we are not supposed to have cd drives at work, somebody is afraid that we may install too private

large programs on the PC's !

Another writer mentioned transistor rectifiers with JFET buffers.
I don't rely on JFETs, in my experience gain will vary with
individual buffers, again making it difficult to calibrate each
detector reading against the other. Too often the voltage gain is only
0.6-0.8 for a source follower. Perhaps I am wrong, but I have just
seen too many incorrect applications of JFETs, they tend to be popular
- particularly when one have not studied any performance data.......

I do not wish to go into details of G3LDO's book explaining how the
measurements can be explained, it is based on an algorithm by Tim
Lloyd G3TML. It is a valuable book for the European antenna
experimenter who still believe "homebrewing" has something to do with
experiments, not information about where to buy.....

Its rather complicated, not difficult but alot of algebra - abit much for email. The equations are in C Bowick's "RF Design" and the ARRL "VHF/UHF Experimenters Manual". I wrote a C programme to implement them a while back, it reads in a file of the four S params in polar form and spits out a file giving I/O imps, ref coeffs, max gain, stability factor etc. I could email you a copy if you like. It is necessary to calculate intermediate quantities, most of which require complex number arguments which is very clumsy to do by hand (even with a good calculator).

Malcolm

Message-ID: <19971215020700.VAA24407@ladder02.news.aol.com>
Source record: 88367

Hi,

I am attempting to set up a low power portable repeater. I am using 2 Motorola MX series portables. The MX, at hte side accessory connector, has a contact that when no signal is present has approximately 0.5 volts, and when it is recieving a signal, approximately 5.0 volts. I am looking for either a relay (I think that would work fairly well) or FET or some other device that will not switch at the 0.5 volts, but switch at approximately 4.0 volts. All the device needs to switch is the PTT ground of the other radio. I have not checked how many amps it is sinking, but I would assume it isn't much. I would prefer, in the interest of power consumption, that the device not need external power sources.

In addition, if any one could help me out with feeding the audio. The MX has 2 contacts which connect to the Speaker Mic, providing audio to the speaker in the mic. Is this emphasized, or deemphisized, how would I check which one it is, and which one would I need to feed into the mic contact on the transmitting radio.

Any help would be greatly appreciated.

## 5311. Conversion to Wilson WU-1510 to 440 Ham band ??

If you knew enough electronics to appreciate a useful response, you wouldn't have posted such a trivial question. Find a library and look up the answer in an
electronics text - we like "The Art of Electronics" by Horowitz and Hill - ISBN 0-521-37095-7 but it was written as an undergraduate text for use at Harvard, so you may want to look out for something by Don Lancaster.

=====

Bill:
I know enough to appreciate a useful response AND I posted this question. So what? You stick to books, I'll stick to newsgroups. You don't want to help? Fine. But we don't need negative responses. If you don't want to help, then don't.

Public libraries are very time-inefficient. Getting there (it's out of the way, parking's a bitch); browsing the electronic catalog (must be a UNIX system; poorly cataloged titles); wandering the stacks; coming back with woefully inadequate information. Whereas the 'net is populated with MILLIONS of engineers, just overflowing with electronics knowledge they are happy to share (well, a few are not, it seems).

But many people realize that the 'net is a great resource (yes, in some ways similar to a library-- but in many ways more like a neighborhood-- only at your fingertips) and are GENEROUS enough to HELP each other without posting ANAL RETENTIVE responses.

Thanks to the many who provided circuit suggestions to help me reach a solution.

Enjoy,
Dave

All of the HF methods, with the possible exception of PACTOR II, have
been sufficiently documented by either the manufacturers or in the
amateur literature that you could homebrew a compatible unit. That's
allowed under Fair Use, and won't get you into licensing difficulties.
Licensing is only required if you're going to manufacture units for resale.

I'm not even sure that the PACTOR I protocol requires licensing. I think,
but could be wrong, that the protocol (not a particular implementation)
was released publicly for amateur use The more advanced PACTOR II,
Clover II, and GTOR protocols do require a license, AFAIK. At least HAL
has publicly *offered* non-exclusive licenses for Clover II to other
manufacturers. I haven't heard of SCS or Kantronics making the same
offer for their protocols.

All that said, I am very much in favor of an *open* protocol for advanced
amateur HF digital. Open standards are very useful in allowing competition
to improve products, and to drive a free market to the best price point.
TAPR and AMSAT collaborated to give us AX25, and warts and all that

standard has done much to make amateur packet widely available and affordable. AMTOR is similarly open, but just isn't good enough. We need to work on a higher performance open HF digital standard that all amateurs, and amateur manufacturers, can adopt and support. I've been beating the drum about this for a while now, but no one has risen to the bait and volunteered any ideas about what this open standard should be, or how we should go about developing it.

>S-Parameters is a simply way of obtaining transistor characteristics.

S parameters are used because they are much simpler to *measure*
than Z or Y parameters. When characterizing a network, you first have
to have some measured parameters. It is very difficult to measure Z
or Y directly for a circuit that contains active components (because you
have to either short circuit or open circuit one port, and that usually makes
active circuits misbehave). But measuring S parameters is relatively trivial.
It is basically no different than measuring SWR. So that's what you do. Then
use a spreadsheet programmed with the transform equations to give you Z
or Y when you input the S measurements. Simple.

If you are thinking about buying a WLC100 Soldering Station (the one for about $30-$40), you might want to read my review.

I don't sell them (or any kind of soldering iron, for that matter). I just bought one, have used it for awhile, and wanted to share my thoughts on it.

You can find it under Construction tips at my Ham Web Site:

# 5325. Data for switch mode transformers?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-16 00:00:00 UTC
From: Robin Birch <robin@falstaf.demon.co.uk>
Message-ID: <ULy0iMAPssl0EwD1@falstaf.demon.co.uk>
Source record: 88232
Cross-posted to: uk.radio.amateur,rec.radio.amateur.homebrew

Dear All,
I am trying to design some power supplies and need addresses of companies that supply transformers already wound and/or bare cores for me to wind them. Can someone send me lists, addresses or fax numbers or URLs for suitable companies so I can hunt up some data sheets.

REgards

SCS has licensed Pactor-II to PacComm and, I believe is willing to license to others. The last I heard, HAL was holding on to the Clover rights - although just about anyone will license just about anything if you are willing to pay enough money.

Try "dry transfer" labels. They do a good job and hold up well if you coat
the panel with clear plastic spray after labeling.

John Welton wrote:

Radio Designer knows about noise if you enter the data.
Read The Manual, Page 17-8, "Data for TWO"

Gerhard, DK4XP wrote:

>Radio Designer knows about noise if you enter the data.
>Read The Manual, Page 17-8, "Data for TWO"

True; that's one of ARRL Radio Designer's many attractive features. Note that what I said, however, still obtains: S parameters for an active device do not in themselves characterize that device's noise performance.

That said, we should also note that ARRL Radio Designer *does*, by design, simulate noise for *passive* TWO elements even though it does not, also by design, attempt to simulate noise for active TWO elements. (See Note 7 [part of the description of the TWO element] on page 15-51 of the ARRL Radio Designer manual.

It's safe to assume that a TWO characterized by Mr. Huisman's S parameter data would analyze as active; therefore, ARRL Radio Designer would not attempt to simulate its noise performance without the addition of noise data. This is why I said, in a discussion that dealt with characterizing a TWO with only S-parameter data, that ARRL Radio Designer would not simulate his device's noise.

You should be able to observe the ripple without a filter (I guess it
really depends on the makup of your signal). I'm picturing a sware wave
signal with ripple on it. If the signal is too large (pk-pk) to offset
with the vertcal position control in the DC coupling mode, AC coupling
might help. You *should* then be able to bring the signal portion of
interest into view. On the other hand if your signal is 20 volts pk-pk,
this method may not work - in which you will have to persue a filter
approach. Keep in mind though that since the ripple is likely odd
harmonics of 30khz your *simple* filter may turn out to be more
difficult than expected. The filter is very likely to distort phase
(and amplitude) of the ripple as well.

Message-ID: <673v4t$836$1@titania.telstra.net.nz>
Source record: 88302

Hi,
Thanks all for feedback on Scattering Parameter - Impedance Conversion.
From the replies received, it seems a drawn out affair to use S-parameters
to find transistor input and output impedance.
This was a surprise to me as all literature I have read so far states that
S-Parameters is a simply way of obtaining transistor characteristics.

I would like to ask another question now, in light of difficulty with
S-Parameters.

How do others determine the input and output impedance of a device for
matching
without using s-parameters ?

I need theses values in terms of R + jX. so that I can match for
1) optimum load for Power Amplifier
2) interstage match between pre-driver and Power Amp.

I would like to write a small utility for Windows 95, so I would just
require the
calculations rather than a URL where I can download a program etc.

Thanks in advance

Regards
Dave Huisman

This is one of those situations though, where building a Pactor
interface is difficult because Pactor & Pactor II are propietary
techniques, and the implementations are licensed before sale
to the public. You have a good point about AMTOR being cheaper
than Pactor, and at least some Pactor implementations allow
an Amtor station to connect, and then have an Amtor connect.

>Lord knows I don't want to start a flame war about how awful AMTOR is.
> It is better than RTTY and for HAMCOM users thats your 2 choices.

In the defense of Cecil, he rarely gets upset about people disagreeing
with him. Pactor, even with the MFJ implementation does have
better features than AMTOR connects, and also can pass let's say
a file better than AMTOR. It is a shame that Pactor is propietary, and
that other modes like Clover & GTor also are, but I guess that's life
in the new HF digital world!

W4ZCB,
What formulae do you enter into the spreadsheet that "does all the work for you".
Where do you get the parameters from to enter into your spreadsheet if you don't use the published data from the data book ?
The Philips Wideband Data Book gives data a "S-Parameters".

Your comments have not answered my question. If you don't use S-parameters to determine input/output impedance of devices, how do you determine these values to enable matching networks to be contrsucted ?

Anyone know of a source for BNC and UHF crimp-style connectors for RG-8X (mini RG-8) cable? Searching Amphenol's web page and the Digikey catalog didn't turn any up.

What goes on in a DSP SSB modulator or demodulator is actually very closely allied to the well-known analogue phasing methods. Anyone wanting to use the Hilbert transform as an audio phase shifter, might just as well include the mixers and summer in the DSP section. The great precision achievable gives potentially far better cancellation of the carrier and unwanted sideband.

Cheers
David

>S-Parameters is a simply way of obtaining transistor characteristics.

An RF design program that's capable of using S parameters to characterize a generic two-port element may also be usable in determining a equivalent R+jX values for a device's input and output. One program I know of that can be so used is ARRL Radio Designer (http://www.arrl.org/ard/), which includes a generic two-port element (called TWO) that can be characterized by S, Y or Z parameters.

What you'd do to get your transistor's input R+ jX, for instance, is set up a simple one-port circuit consisting of a TWO, characterized by your S parameter data, with a 50-ohm resistor connected across its output and its one port connected to the TWO's input. After analyzing the circuit, ask Report Editor to plot RZ11 (the real part of Z11) and IZ11 (the imaginary part of Z11) for the circuit. This gives you your device's input R+jX at (and interpolated between) the frequency points in your S-parameter data.

For output R+jX, you'd set up a circuit consisting of a TWO, again characterized by your S parameter data, but this time with a 50-ohm resistor connected across its *input* and the circuit's one port connected to its output. Plotting RZ11 and IZ11 for *this* circuit would give you your device's output R+jX at (and interpolated between) the frequency points in your S parameter data.

This technique is highly conditional, for a host of reasons--a set of S parameters is derived only a a given bias point, for one instance; for another, S-parameter data doesn't characterize an active device's noise performance (and ARRL Radio Designer therefore won't be able to tell you anything useful about your device's noise performance through this TWO-based approach)--but can be quite useful for a first cut at a linear amplifier design.

Regards,

David Newkirk, W9VES

## 5356. Where to get rack panel silk screening

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-16 00:00:00 UTC
From: John Welton <John_Welton@unc.NoSpam.edu>
Message-ID: <01bd0a2d$d01b5460$d5e70298@JWELTON.UNCH.UNC.EDU>
Source record: 88317

Anyone know where we can send out a rack panel for silk screening (at a reasonable price)? We're building an interface board for our repeater system and putting it in a Jameco rack/chassis and would like to do something better than label makers on the front panel.

Second choice would be decals (white lettering) - anyone have any recommendations.

Thanks, John, N4SJW

And some of us are okay with English, but not with ham-speak. :-)

I don't know how many of you recieved the schematic for the tiny FM
transmitter based on two 2222As, but I have a question. I'm trying
to emulate it in Micro Cap V. I made a macro for electrolytic caps
by putting a 1Meg resistor in parallel with a bi-polar cap to represent
the leakage. Is this sufficient to emulate an electrolytic?
Should a 5V +/- 4V sine wave emulate the electret microphone?

Source record: 88171

Yes and no.

Inductors are commonly marked with a color code that approximates
the resistor color code, but the multiplier is not always defined.

But there's more -- some inductors are color-coded by PART NUMBER,
same as some sub-watt zener diodes. And small tubular capacitors.
And that make life hell.

Your safest bet is to test for value. You can get a cheap but
reasonably repeatable and accurate digital inductance meter for under
US$100. nowadays, and it's a handy device for quick guesses.

FWIW, most components change value with age -- most notably,
capacitors (which should be junked when they're old enough to vote)
and carbon resistors, which all need to be checked before re-use.

But hey, why do we call it the junk box, after all?

Almost any MMIC will give acceptable gain to 2 GHz. For a start,
take a look at the November 1997 QST pre-amp article.

For frequencies above 500 MHz, the PC board material and geometries
are more critical -- there have been a number of articles in QST
and QEX on this particular topic over the last decade. G-10
(the standard light green glass-epoxy) is marginally usable
to 2 GHz if you're lucky. Rogers has some inexpensive substrates
available now that are very good (and they sample if you ask right).
Duroid 5880 or similar is not required -- but it's easy to use,
easy to make work, and easy to have a seizure over the price.

For specifics on good MMICs to use, see the Mini-Circuits Designer's
Handbook. You should be able to talk that company out of a
free copy. MMICs are typically in the $3. each range, so you
can afford to blow a few up while experimenting.

50-ohm stripline design is trivial if you know the characteristics
and thickness of the substrate. And MMIC design apps are trivial,
except that biasing needs to be done right.

I rcall once seeing a set of plans for cavities in the "other" amateur
radio handbook, I think the book is by Bill Orr. They wasn't tin can,
but made from sheetmetal some how.

Gary,

Thanks for the reply.

Do your calculations take into account the fact that the
input impedance is modified depending on what is
connected to the output and visa-versa ?

Could you give me some of those simple calculations
to convert S-Parameters into Zin and Zout.

Much appreciated.

Regards
Dave Huisman

Look under "screen printers" in the yellow pages. Some of the T shirt
companies can do electronic panels. Also, you might find one who
cpecializes in electronic panels.

I use Toltec in Albuquerque. They do a good job for a reasonable
price.

: What Radio Designer does, it does quite well. But it doesn't do a lot.
: Get MicroSim's free demo CD for DesignLab and you may find that it
: does everything you need (the demo is limited to 30 components, but
: otherwise is their full product including schematic capture, board layout,
: auto-router, Spice simulator with simulated scope probes, and it does
: digital as well as analog, including programable gate arrays). If DesignLab
: can't do it, you probably don't need it. If the demo version's 30 component
: limit is too constraining, spring the $13,000 for the real thing.
:
: I find that 30 components is enough for most circuit modules, so I
: use their demo almost exclusively. I'd pay at least as much as I paid
: for Radio Designer to up the limit to 100 components, but there's
: no way I'm forking over $13,000. (They offer a student deal for $1,300,
: but that's still a little bit too steep for me.)

Gary, thank you, thank you for a nice free answer to my prayers :-) .
DesignLab's demo is even downloadable at http://www.microsim.com -- 15
megs, plus documentation in .pdf format, 7 or 8 modules in the 1 to 4 meg
range.

It's going to take some work to learn, but for heaven's sake, you can
enter the schematic graphically and not deal with netlisting like Radio
Designer!

Interesting they don't mention prices in dollars on the web site... but
the "educational discount" is quoted as 95%!

Mouser's catalog (oops, Purchasing Manual) 592, prices guaranteed until
January 31, 1998, lists 60/40 rosin core Kester 44 in eleven different sizes/
weights. They also have 60/40 solid wire and bar solder.

>Yopu can find it but no one will ship by FED EX . In fact the only

No mention is made about shipping limitations or surcharges for either
ground or air. But they do say that there is a UPS hazardous material
charge per shipping carton for both liquid ferric chloride and dry ammonium
persulphate powder, but do not say anything about ground only.

There is no conversion necessary - just program in the desired
frequencies and retune to the amateur band. Tuneup is a bitch,
esp. the coils in the first stages of the transmitter which also
provide the L.O. signal for the receiver.

Finding a book shouldn't be too hard. Wilson doesn't make them
anymore but Regency (or RELM) makes the same radio with a different
model number.

Note: If yours is the 10 channel version, there are some differences
between the programming of the older 10 channel and the newer 16
channel radios. Good luck !

I used to work at a screen printer.It will be at LEAST $50 to do what
you want via silk-screen.A lot cheaper method is to use a graphic art
program on your pc to draw the panel you want,take the disk to your
local photo shop that will print files,have them print it on a
bumper-sticker type material,then apply that to your panel,then mount
the hardware.

Dave,
I hope someone has pointed out that "both Y and S parameters for a power transistor are called small-signal parameters, and should not be considered in the design of rf power amplifiers" (Bowick) Rather, the manufacturer's data sheet should be consulted for the input and output impedances.

Regards,
Richard

Just my two cents.
The best deal going on a good quality soldering station is the WCC100.
Tucker has it for $105.
The WLC100 has old fashion tips that are held in with a screw from the
side. This can only lead to big problems when you want to change the
tip and find the screw frozen in place. I have used the WCC100 for
everything from large power supply lugs to fine pitch Flash ROMs.
Stay away from the irons that use the magnetic temperature control.
These use the tips with the 6,7, or 8 on the end. Many surface mount
components have magnetic leads that will stick to the of the tip and
barrel of the soldering iron and drive you crazy.

# 5395. AD9850 DDS SSOP adapter PCB

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-17 00:00:00 UTC
From: Leon Heller <leon@lfheller.demon.co.uk>
Message-ID: <btGe8HAJI+I0EwhZ@lfheller.demon.co.uk>
Source record: 88267
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.digital.misc

If anyone is interested in prototyping with the AD9850 DDS chip, using "ugly" construction on a ground-plane, I've had some mounted on a small PCB (0.8 mm thick), with the leads brought out to staggered .05" spacing pads. You are unlikely to get usable 125 MHz operation with these, but they are ideal for experimentation, and should be OK at 75 MHz, for a wide-range DDS osc. covering < 1 Hz up to 30 MHz. I've just ordered a 75 MHz osc. to check it out.

I've got a simple circuit working using one of these PCBs, with a 25 MHz clock oscillator (the fastest I have in the junk box) configured via the PC printer port with a C program, using serial loading. I'm in the process of adding a 10 MHz LP filter to clean up the output. I'll eventually be using an Atmel AVR 1200 chip for controlling the DDS and an LCD, keyboard and rotary encoder I/F.

AD9850 data is available from www.anaolog.com.

Please email me for further details.

## 5396. Junkbox component values??

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-17 00:00:00 UTC
From: Clinton Peebles <cpeebles_NOSPAM_@nel.auracom.com>
Message-ID: <678sdi$j8i$1@noc.vphos.net>
Source record: 88268

I have several circuit boards in my junk box and would like to know how to find the values of some of the components, mostly the coils. Is there a code for decoding the value of these or do different manufacturers use different codes? For example, one board has several Mitsumi coils on it and the tuning slugs are different colors. Do the colors signify the value or can I figure them out from the numbers? One with a purple slug has 101 5 7AF and 7.8KD. Others have no markings at all so I guess there is no way of telling the values..

Is this for real or is it a misunderstanding? I have never heard normal
lead-tin alloys are so dangerous they cannot be shipped by normal
methods, including Fed Ex or UPS (air or surface). If shipping the
solder is forbidden, one might expect shipping electronics containing it
to be forbidden as well- but again, I have doubts.
I have used the solder with only tin (no lead) and 5 % silver and it
is certainly NOT crappy. The stuff is far stronger than the lead-tin
kind, and flows nicely.

SCS gives PacComm *US manufacturing rights* to build *an exact copy* of
the PTC-II. It isn't a matter of just licensing the protocol so PacComm could
implement it on their own hardware design.

>The last I heard, HAL was holding on to the Clover rights - although just
>about anyone will license just about anything if you are willing to pay enough
>money.

HAL has repeatedly and publicly offered to license the Clover II protocol
to other manufacturers. I understand that they are even willing to do this
on a reciprocal basis, IE if Kantronics would give them a license for GTOR,
they would give Kantronics a license for Clover II for example. Now if you
wanted the source to their executable DSP code, that might be a different
matter. That *is* rightfully a proprietary competitive advantage that they
likely value rather highly.

Hi,
"RF Circuit Design" is one of the text's that I have been referring to.
Some of the larger power RF transistors from Motorola show part
of a Smith chart with impedances plotted but I am working with lower
power devices and they only give the data in S-Parameter format.
Check out Philips SC14 "RF Wideband transistors ...".
Lets say you want to design a 100mW output stage using the BFR90A.
If you looko at the data (Page 857), you will find that the device is
suitably characterised in S-Parameter format. Thus if I had the
conversion equations , Zin and Zout could be determined for a given
Vcc and Ic.
Also, when you talk about Large Signal versus small signal analysis,
What do you do for interstage matching (small signal) ?

To quote from "Radio Frequency Transistors, Principles and Applications" by
Motorola (Norm Dye and Helge Granberg).
"Today, all low power RF transistors introduced to the marketplace are
characteriezed with S-Parameters, ..."

[repeat of same procedure for output deleted]

And Wes Stewart wrote:

>Why not just set it up as a two port in the first place and not worry
>about the 50 ohm terminations?

Because when you ask ARRL Radio Designer for RZ11 and IZ11 of a two-port network, the program leaves the network's output port unterminated. This can lead to significant errors in the values reported for RZ11 and IZ11 if the network doesn't exhibit very high reverse transmission gain, as will be the case for many active devices. (Likewise if you ask for RZ22 and IZ22 of a two-port; then, the program leaves the network's input port unterminated.) The "two-port as explicitly-terminated one-port" approach end-runs this effect by duplicating the opposite-port termination used in determining the network's S parameters.

Not that many of us could afford its five-figure price for home and hobby use, but the 32-bit successor to ARRL Radio Designer's parent program includes ZIN and ZOUT among its two-port responses. These allow you to set opposite-port terminations *within Report Editor* while reporting the analyzed two-port's input and output impedances, making the "two-port as explicitly terminated one-port" workaround unnecessary in characterizing the input and output impedances of two-ports.

Yes. I built one for 20m and have one of the Mutek ones that does allHF bands (which I never use). It is 10W out, which is nowhere near enough in the sunspot minimum.

You might find it more convinient to convert an FM CB rig. These have narrower filters than common 2m rigs to cope with 10 kHz channel spacing.

They are dirt cheap and you can leave it in the car without having to worry about it being pinched, though I see you are from Oz where crime is low anyway.

Hi All (again!)

On Tue, 16 Dec 1997 18:44:55 -0000, "Nick" <nick@no.spam.for.me.ta>
wrote:

>Check this month's Practical Wireless. They have an article about cavity
>filters using large food tincans & copper waterpipe. Not too practical for
>6m, but interesting reading.

Hmmm.... I saw the article and thats what prompted me to post the
message...

cheers anyway Nick...

A few people have emailed me direct and asked for details of the use
of the cavities... possibly best to describe here rather than in 10
emails :-)

Basically, Ive got quite a few propogation monitoring projects running
at present - magnetometers (ECM and fluxgate), Barometric pressure
sensors, beacon monitor, etc linked up to my home network which is
building up a database of info. One project I wanted to add was a
widefreq averaging RX. The idea being that it would listen to ALL
freqs between 48 and 52Mhz and use a simple RF stage followed by a
rectifier giving an averaged voltage for all sigs (and noise) in the
range of RXd freqs.

Ive had the rear end of the RX built for some time, but have had
several iffy sessions of 7 pole filter designing and no real success
to date - Hence the thought of using a cavity. Because the unit
will be RX only and can tolerate an insertion loss of up to 10dB (Ive
got gain to spare in the rf stage) Im sure that beer barrel / Tin Can
designs will suffice, and most likely be more efficient and more
reproduceable than multi Pole LC filtration...

Repeatability is important as Im hoping to get a few people using
similar kit throughout the uk and collate info from all to null out
any localised QRM/QRN etc.

Eventually I hope to have the data from all prop monitoring equip
feeding live data to my website and to run a listserver with auto
mailout to subscribes with stats and alerts...

Thanks again to everyone who has e-mailed me direct on the cavities
and I would welcome any comments on the above project ;-)

cheers - Chris Williams - g7nbp

oh - almost forgot, Merry Christmas!

No! I won't just "tell you the answer"! Why? Because I think that SOME
amount of research ability MUST be inculcated into every electronics
wannabe! In this case, you don't NEED to "go to a library: (drive, park,
browse without understanding Dewey decimal system, etc., <you moron, ask a
librarian!>), and it has NOTHING to do with the UNIX filesystem, which is
the simplest and most obvious of any OS. You simply need to have purchased
any old used thrift-store BOOK on electronics!! If you have NOT, then you
really aren't SERIOUS enough to take as deserviong of our free labors to
teach you!! Come back when you can ASK a question ABOUT something you tried
which didn't work as you had reason to expect, and quit expecting us to be
an encyclopedia for you!! We are NOT "MILLIONS" of engineers, actually
there are fairly few of us who POST, versus a ratio who LURK which is 15
TIMES greater!! Many engineers will not even COME here to talk to you,
they see you as LAUGHABLE!! It is ONLY a very few of us who feel some
responsibility for public education who BOTHER to come here!! MOST
engineers simply won't "work" for you without being paid, and see you and
even US as laughable and naive as to our understanding of your fatuousness!
Until we develop a teaching engine which can learn and surmise from among
all sources on the Net/Web, and which decides to deal with your questions
automagically, this all is going to require an amount of genuine human
EFFORT, which you seem to deride for YOURSELF, which is why you got CALLED
a silly ass in the FIRST PLACE!! You don't value YOUR effort, why should WE
expend OURS on you? I got news for you by way of a HINT: It's a trivial
question found in any book on basic AC studies and RC circuits!! It's found
in virtually EVERY ONE OF THEM!! It's too basic for US to rewrite for you
in this instence. THAT'S what you were being told by the previous poster!
Go READ something! THEN ask questions!!

Check the June 1986 issue of 73 magazine, it has a 2 to 10 meter
transverter for FM use. I have a couple of the PC boards (available
through FAR Circuits) and hope to make a 6 meter version of it.

The hum is probably from bad filter caps. Just replace all electrolytic caps with new ones of same or greater capacity and same or greater DC working voltage. Be sure to observe polarity and connection points (i.e., the negative lead(s) may not necessarily be connected to the chassis groun as one might expect!). Remove the old caps from the circuit entirely.

As to the "James" unit - my guess is that it's a vibrator. You may have an amp that is AC/DC - designed to work either from household mains or from 6v DC. All the tubes will work with 6v on the heaters and the vibrator is used to mechanically chop the DC into something close enough to AC to be stepped up via a transformer for B+. Vibrators were very common in pre-transistor car radios.

>Would someone please explain the Smith Chart to me?

Dear Bert,

You've already received several links to written material on the subject and a couple of explanations ( I like Madjid's explanation the best), but I would like to give you something that may be easier to visualize or relate to.

The Smith Chart can be thought of as a "Visual", as opposed to "mathematical", way of transforming one impedance into one or more different impedances by means of a length of transmission line. Remember that a piece of coax or balanced transmission line is a distributed transformer, whose transformation effect is a function of its length and characteristic impedance, and the frequency.

If you want to perform the necessary calculations mathematically, you may do so, but the use of the Smith Chart makes it more like a nomogram or slide rule, in that you have a visual procedure for moving around on the complex plane in a specified way (around a circle of constant SWR) in order to obtain the results quickly.

A computer program can do the job with less fuss and with greater accuracy. I have one on my Web site that you can download for free. Look for SC.EXE

is that the reason why every stn is so weak?
I planned QRP on 30m, but it seems not good for QRP, you need 100W
with a halfwave vertical to be heard....

Just a thought, if you want to stick with cavities, you could try air-conditioning ducting from a local installer. 1.5m of the stuff shouldn't be too expensive. The ends could be a flanged plate rather than a cap. I'm not sure if you can solder to galvanised steel though - not something I've tried.

>range of RXd freqs.

Also, why is is important to monitor the average across the band, bearing in mind that different signals within the band would beat & the result could be odd to say the least, especially if you're just taking a DC value in the end.

How about.. You could try a standard Rx design, but using a 4MHz wide sweep as the local osc to sweep the band. Then rectify the IF output into a low pass filter / integrator or whatever.

I disagree - I find powers around 10 watts sufficient, particularly on 10 metres. Even that sort of power to a fairly mediocre antenna (eg a 6ft mobile whip) when used pedestrian mobile on 10m has yielded many solid contacts on SSB and a few on AM. However on FM a bit more power may make operating a bit more pleasant.

>You might find it more convinient to convert an FM CB rig. These have

>anyway.
>

All CB here is SSB/AM, and not FM. There are nowhere near as many FM sets here as there are in the UK - any 27 MHz FM set would have to come from a CB pirate.

# 5420. Three 5v 200a Supplies - Verify Info?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-18 00:00:00 UTC
From: DavidC <davidc@bit-net.com>
Message-ID: <01bd0bed$57b3d580$0b8a92d0@bitnet.bit-net.com>
Source record: 88208

I have acquired three 5V 200A power supplies (amazingly small, about 12"deep x 5"wide x 8"high, though very solid and heavy). (They came with a bunch of other stuff)

They are JETA Power Systems, Inc. Model G1001-1
Label says Input: 3 phase 208v 3.5a 47-400hz
or 230v 9.6a 47-60hz
Output: 5v 200a

Each unit has its own built in fan, massive plated connection posts, etc.

Do I assume correctly that I can run standard 220-230v into one of these little beasts (at the properly labeled terminals)and get 5v at 200a out?

So if I tie the outputs of two in series and crank the voltage up to 6 or 6 1/2v (there's a voltage adjustment slot), I could end up with usable 12-13v at 200a?

What's the potential downside as a shack supply?

Anyone know these specific devices? Anyone have a schematic, etc, to share?

Any good alkaline charging circuit should include a heavy steel
case lined with plastic. The plastic keeps the caustic stuff that
drips out of the battery from weakening the steel case that keeps
in the explosion.
OH, rose-colored glasses will help you believe you're actually
recharging them. :-)

From: Leon Heller <leon@lfheller.demon.co.uk>
Subject: AD9850 DDS SSOP adapter PCB

If anyone is interested in prototyping with the AD9850 DDS chip, using "ugly" construction on a ground-plane, I've had some mounted on a small PCB (0.8 mm thick), with the leads brought out to staggered .05" spacing pads. You are unlikely to get usable 125 MHz operation with these, but they are ideal for experimentation, and should be OK at 75 MHz, for a wide-range DDS osc. covering < 1 Hz up to 30 MHz. I've just ordered a 75 MHz osc. to check it out.

I've got a simple circuit working using one of these PCBs, with a 25 MHz clock oscillator (the fastest I have in the junk box) configured via the PC printer port with a C program, using serial loading. I'm in the process of adding a 10 MHz LP filter to clean up the output. I'll eventually be using an Atmel AVR 1200 chip for controlling the DDS and an LCD, keyboard and rotary encoder I/F.

AD9850 data is available from www.anaolog.com.

Please email me for further details.

From: Jim Strohm <jstrohm@txeas.net>
Subject: GPS Antenna AMP plans

Almost any MMIC will give acceptable gain to 2 GHz. For a start,
take a look at the November 1997 QST pre-amp article.

For frequencies above 500 MHz, the PC board material and geometries
are more critical -- there have been a number of articles in QST
and QEX on this particular topic over the last decade. G-10
(the standard light green glass-epoxy) is marginally usable
to 2 GHz if you're lucky. Rogers has some inexpensive substrates
available now that are very good (and they sample if you ask right).
Duroid 5880 or similar is not required -- but it's easy to use,
easy to make work, and easy to have a seizure over the price.

For specifics on good MMICs to use, see the Mini-Circuits Designer's
Handbook. You should be able to talk that company out of a
free copy. MMICs are typically in the $3. each range, so you
can afford to blow a few up while experimenting.

50-ohm stripline design is trivial if you know the characteristics
and thickness of the substrate. And MMIC design apps are trivial,
except that biasing needs to be done right.

SCS gives PacComm *US manufacturing rights* to build *an exact copy* of
the PTC-II. It isn't a matter of just licensing the protocol so PacComm could
implement it on their own hardware design.

>The last I heard, HAL was holding on to the Clover rights - although just
>about anyone will license just about anything if you are willing to pay enough
>money.

HAL has repeatedly and publicly offered to license the Clover II protocol
to other manufacturers. I understand that they are even willing to do this
on a reciprocal basis, IE if Kantronics would give them a license for GTOR,
they would give Kantronics a license for Clover II for example. Now if you
wanted the source to their executable DSP code, that might be a different
matter. That *is* rightfully a proprietary competitive advantage that they
likely value rather highly.

From: "Clinton Peebles" <cpeebles_NOSPAM_@nel.auracom.com>
Subject: Junkbox component values??

I have several circuit boards in my junk box and would like to know how to find the values of some of the components, mostly the coils. Is there a code for decoding the value of these or do different manufacturers use different codes? For example, one board has several Mitsumi coils on it and the tuning slugs are different colors. Do the colors signify the value or can I figure them out from the numbers? One with a purple slug has 101 5 7AF and 7.8KD. Others have no markings at all so I guess there is no way of telling the values..

From: Jim Strohm <jstrohm@txeas.net>
Subject: Junkbox component values??

Yes and no.

Inductors are commonly marked with a color code that approximates the resistor color code, but the multiplier is not always defined.

But there's more -- some inductors are color-coded by PART NUMBER, same as some sub-watt zener diodes. And small tubular capacitors. And that make life hell.

Your safest bet is to test for value. You can get a cheap but reasonably repeatable and accurate digital inductance meter for under US$100. nowadays, and it's a handy device for quick guesses.

FWIW, most components change value with age -- most notably, capacitors (which should be junked when they're old enough to vote) and carbon resistors, which all need to be checked before re-use.

But hey, why do we call it the junk box, after all?

Dave,
I hope someone has pointed out that "both Y and S parameters for a power transistor are called small-signal parameters, and should not be considered in the design of rf power amplifiers" (Bowick) Rather, the manufacturer's data sheet should be consulted for the input and output impedances.

An RF design program that's capable of using S parameters to characterize a generic two-port element may also be usable in determining a equivalent R+jX values for a device's input and output. One program I know of that can be so used is ARRL Radio Designer (http://www.arrl.org/ard/), which includes a generic two-port element (called TWO) that can be characterized by S, Y or Z parameters.

What you'd do to get your transistor's input R+ jX, for instance, is set up a simple one-port circuit consisting of a TWO, characterized by your S parameter data, with a 50-ohm resistor connected across its output and its one port connected to the TWO's input. After analyzing the circuit, ask Report Editor to plot RZ11 (the real part of Z11) and IZ11 (the imaginary part of Z11) for the circuit. This gives you your device's input R+jX at (and interpolated between) the frequency points in your S-parameter data.

For output R+jX, you'd set up a circuit consisting of a TWO, again characterized by your S parameter data, but this time with a 50-ohm resistor connected across its *input* and the circuit's one port connected to its output. Plotting RZ11 and IZ11 for *this* circuit would give you your device's output R+jX at (and interpolated between) the frequency points in your S parameter data.

This technique is highly conditional, for a host of reasons--a set of S parameters is derived only a a given bias point, for one instance; for another, S-parameter data doesn't characterize an active device's noise performance (and ARRL Radio Designer therefore won't be able to tell you anything useful about your device's noise performance through this TWO-based approach)--but can be quite useful for a first cut at a linear amplifier design.

[repeat of same procedure for output deleted]

And Wes Stewart wrote:

>Why not just set it up as a two port in the first place and not worry
>about the 50 ohm terminations?

Because when you ask ARRL Radio Designer for RZ11 and IZ11 of a two-port network, the program leaves the network's output port unterminated. This can lead to significant errors in the values reported for RZ11 and IZ11 if the network doesn't exhibit very high reverse transmission gain, as will be the case for many active devices. (Likewise if you ask for RZ22 and IZ22 of a two-port; then, the program leaves the network's input port unterminated.) The "two-port as explicitly-terminated one-port" approach end-runs this effect by duplicating the opposite-port termination used in determining the network's S parameters.

Not that many of us could afford its five-figure price for home and hobby use, but the 32-bit successor to ARRL Radio Designer's parent program includes ZIN and ZOUT among its two-port responses. These allow you to set opposite-port terminations *within Report Editor* while reporting the analyzed two-port's input and output impedances, making the "two-port as explicitly terminated one-port" workaround unnecessary in characterizing the input and output impedances of two-ports.

From: geotek@flex.net (George Carlson)
Subject: Weller WLC100 Soldering Station

Just my two cents.
The best deal going on a good quality soldering station is the WCC100.
Tucker has it for $105.
The WLC100 has old fashion tips that are held in with a screw from the
side. This can only lead to big problems when you want to change the
tip and find the screw frozen in place. I have used the WCC100 for
everything from large power supply lugs to fine pitch Flash ROMs.
Stay away from the irons that use the magnetic temperature control.
These use the tips with the 6,7, or 8 on the end. Many surface mount
components have magnetic leads that will stick to the of the tip and
barrel of the soldering iron and drive you crazy.

You could get one from the UK, but if you can get an SSB/AM set cheaplyyou can
soon convert it to FM/CW as well. Much simpler than building a transverter.

Actually, any alkaline cell can be recharged, however, there is an very
critical "terminal to terminal Vmax" that cannot be exceeded.
Said voltage is not much greater than the no load terminal voltage, and
since dc current flow is resistance/voltage difference, it is not possible
to recharge to origional capacity. If the critical terminal voltage is
exceeded briefly, in the order of hundreds of millivolts, the plastic
lined, heavy steel case, is a necessity.

But still quite manageable for a pedestrian mobile station if you mount it on a solid hand-carried box that also contains the radio and the battery. Provided you also use a 2.5m trailing wire for the ground, there's no reason why a pedestrian mobile station on 10m need be much less effective than a similar station installed in a car.

You've touched on one of the big problems with hand-held rigs, whether commercially-made or homebrew. It's hard to attach any sort of decent antenna on them - the slightest movement of a substantial antenna as one was walking along would put strain on the antenna connector and a big antenna with a little radio is mechanically unbalanced and a bit hard to carry. Better to use a mobile radio, substantial box and a standard mobile antenna mount for durability. A shoulder strap or handles makes carrying such a station (though it may be heavier than a hand-held) much easier than using a hand-held with an antenna of eqivalent efficiency. The other benefit is the bigger battery possible - 2 or 3 hours of operating time (at 12w PEP) is no problem for a decent pedestrian mobile station.

A 6ft whip would be a bit tricky to use on a bus or train. It should be possible to use a 3 ft whip on board, but it would be less efficient and I've never done it.

Not necessarily, Scalar network analyzers only measure and
display magnitude, using broad-band detectors. These are commonly used
in conversion systems, such as superheterodyne receivers, where the
output and input are of different frequencies. Measuring phase under
those conditions takes a lot of effort and $$.

The Wiltron 640 is a good example of a scalar analyzer.

I need a simple relay circuit that will connect a PTT line to a transmitter when the device that triggers the relay (or whatever is needed) conducts. I have found an unused pin out on a motorola MC3359P that is in my scanner that conducts when the squelch is open. You see, when the squelch is open, I would like the transmitter to . Pin 16 AUDIO MUTE is connected to ground when the squelch is open. But what is REALLY neat is that pin 16 isnt even used, meaning I can do whatever I want with it. One hitch though, very small current (a few ma) and no more than .7V can be used. Please tell me if you can help. Greatly appreciated.

Input/output power levels?

The 1997 ARRL Handbook has a big 'un on p. 13.29, and a smaller
6-meter amp that could be padded down to 10 meters on p. 13.38.

I think Motorola Application Notes EB-63, AN-762, and AN-758
are still in print. These will light your fire -- all these
designs are adaptable to nearly any NPN RF transistor that works
in HF.

I have a stack of amp plans that date back to the 1950s, and
I've kept the ones that are easiest and cheapest to build.
But I won't completely give away all my best secrets.

Try this:
http://www.motorola.com
and search for the application notes. It'll do you good.

I'd be interested to hear the results of your work.

I read that article with some interest, and made some minor
forays into the experiment -- but with the foreknowledge that
it appeared in the APRIL issue, and Wayne Green has been known
to pull some legs.

It's worthy to note that a kilowatt on 2400 MHz is still a kilowatt,
no matter what it began life as. I'm surprised that there's not
more experimentation with microwave oven magnetrons. Seems like
there should be a relatively cost-effective way to provide frequency
stabilization for moonbounce work -- cost-effective relative
to what a TWT or solid-state alternative would cost.

Because of the high power levels involved, I'd be reluctant
to use this much juice for point-to-point terrestrial contacts.
I'm bookmarking your page.

Hi, John,

The TTL 7417 is a hex buffer/driver. It does not invert so its logic function is trivial. (The 7416 is the inverting version.) Its primary use is simply to buffer an input signal to solid TTL levels.

If you are sure that is what you want just send me an address and I'll send you a few.

If you are useing RF power FETs in low power range 100 mW to 1 watt
range the small signal S-parameters will get you very close. It will
not be an exact solution, but close enough if using variable component
to gain a decent match.

Seasons Greetings,

Good call, Steve....:-}

The old vibrators were used, as Steve stated, to turn DC into something that resembled AC, which could be stepped up for plate voltages, screen voltages, or whatever was needed. They were neat devices with a set of "break" contacts in series with the relay type winding. The timing on the break was designed so that it gave even pulses which were then filtered before stepping up in voltage. The contacts had a bad habbit of burning out. They were pretty common in the junque-yard car radios from which we scrounged parts when I was a kid in the early 1960's.

"Usable" is a relative term. I'm currently developing a product operating at 5.8 GHz, and it's entirely on epoxy-glass board. I know of one similar commercial product operating at 10 GHz on epoxy-glass. Both include an oscillator and simple receiver. The board loss would very possibly be enough to degrade a low-noise amplifier, though, and I wouldn't try to make a high-Q filter on it at these frequencies.

For a very nice program do a web search for DTMF_FFT (don't recall the
web page), or email the author emil@interlog.com

here are some details:

DTMF_FFT version 1.00
a DTMF & CTCSS generator and decoder &
a spectrum analyzer program for DOS
Copyright (C) 1996 Philip VanBaren & (C) 1996 Emil Laurentiu
(YO3GGH)

PROGRAM FILES:

DTMF_FFT.EXE is a program for the Soundblater compatible cards.

The program samples the input, performs an FFT, and graphs the output.
It
also decodes and generates DTMF numbers and the sub-audible CTCSS
tones.

INI file and command line options provide the user with the ability to
select linear/log frequency and amplitude scales as well as sampling
rates,
length of the FFT, DTMF generating speed, threshold DTMF and CTCSS
level etc.

>emil, ak9i

After the joking of my fellow friends, I'll try to give you a
technical answer: In a word, NO.
I personally own a commercial, specially designed charger for
alkalines from Saitek. It implements a special charging algorithm
(designed to eliminate the need for that plastic lined steel case. I
originally bought it because I had equipment (a palmtop PC) that
required the 1.5V of alkalines and wouldn't work on 1.25V NiCd cells
due to insifficient voltage. Well, I did manage to recharge some but I
never was sure how full they were recharged. What ended the story was
that they started spilling after several recharges, once inside my
scanner (lucky it had a removable - and washable - battery cage, and
that this has not happened in my palmtop!). Conclusion: I won't take
chances anymore, although I've heard there are special rechargable
Alkalines designed for this application with a special charger, all
from Rayovac.
Just my 2 cents...hope that helps.
cheers!

Hello All,

I'm trying to modify my radio to receive high speed digital data, such as packet radio. Apparantly, just tapping the discriminator and adding a data slicer isn't enough. The data comes in as junk, due to phase distortion by the IF filter. I probably need to replace the IF filter. Is anyone here experienced in this field and can give a helping hand? I'm talking about 8000 baud and up (packet is 9600?).
Thank's a bunch for any help offered. Cheers!

>David Newkirk, W9VES

Well, I should have known this, as I reported this behavior to you and
Dr Rohde almost three years ago. Only, after talking to Dr. Rohde on
the telephone at that time, I thought that he was going to fix this
among other problems with the release of version 1.5.

You should recall that I offered the example of a 3 dB pad that consists of two shunt 17.6 ohm resistors on the input and output respectively, with a 292 ohm in series between them.

Radio designer will correctly report an S21 of -3.00 dB, and an S11 of -71.1 dB. However, it will incorrectly report a MZ11 of 150.3 ohm. It does indeed magically disconnect the output 50 ohm port to report the MZ11.

As I pointed out to Dr. Rohde, when I use my HP8510C network analyzer, to actually measure something such as this, it doesn't disconnect itself when presenting the magnitude of the input impedance.

When my company spends five figures for RF CAD stuff, its HP/Eesof, so I can't comment on the "pro" version of Compact.

Of course, most of the blame for the confusion lies with the absolutely absymal manual supplied with the program. It seems to be a cut-and-paste job using the Super-Compact manuals as a source and it suffers accordingly. I mean really, why is there stuff on time-domain analysis in the manual, when the program doesn't have it?

Guys,

Why reinvent the wheel? The "Renewal" stuff from Ray O Vac works VERY
well!
The cells are manufactured a little different, but the the system works!
Remember unlike NiCads Renewals like to be charged (No memory). Recharge after each use, NOT when they die. I have some that have been charged over 100 times and going strong. The charger is cheaper than you or I could build anyway. NO steel case, and a nice (LED goes out) indication of when they are charged.

If you are curious about the brass tacks of the deal QEX did a really nice article a while back. Contact the ARRL for more info.

73,
Joe

There may be an easier way to do what you want.

Theres a homebrew anemometer at
http://www.alphalink.com.au/~derekw/ane/anemain.htm
which may be of interest. It reads speed and direction.
It has a serial port, so your computer can read the wind data.

It's actually not a problem; it's appropriate behavior, because what we're asking for by requesting Z responses in ARD are--as I'm sure you know--*Z parameters*, which by definition are determined for a given port by leaving the opposite port(s) unterminated. If you go after Z parameters with a real Z-parameter test set, it, too, will unterminate the opposite port of the device under test. (In my earlier post, I used the phrase *significant errors* in the sense that what Dave Huisman sought was his two-port's input and output R+jX, not the the real and imaginary parts of its Z parameters Z11 and Z22.)

Super-Compact and Microwave Harmonica 6.5, supersets of ARRL Radio Designer 6.5, also exhibit this (appropriate) behavior in the reporting of Z parameters. So does their 32-bit successor--but it also includes ZIN and ZOUT, as well as YIN and YOUT, response options--which allow you to report a two-port network's port impedance (ZIN/ZOUT) or admittance (YIN/YOUT) in the presence of explicit, definable-after-analysis terminations.

>You should recall that I offered the example of a 3 dB pad that

>
>As I pointed out to Dr. Rohde, when I use my HP8510C network analyzer,
>to actually measure something such as this, it doesn't disconnect
>itself when presenting the magnitude of the input impedance.

It will disconnect itself if what it's actually measuring are *Z parameters*--unless, in determining Z parameters it's actually measuring S parameters and then doing the necessary math to convert them to Z parameters. :-D Again, remember: measuring a network's input and output R+jX and input and output Z parameters may validly result in *different numbers*, depending on the terminations used in determining R+jX.

That said, for the record, bring up Modify Reports for the MZ11 report for your 3-dB pad and look carefully at the terminations reported for that response. You'll see *no* termination shown for Port 2--as is appropriate considering the definition of Z parameters. If ARD didn't report MZ11 as 150.3 ohms under that condition, it would be defective. If what you're trying to do is use ARD's Z-parameter reporting ability to get R+jX, you must hard-code the appropriate termination across the opposite port unless you want to report R+jX with the opposite port open.

[deletion]

>Of course, most of the blame for the confusion lies with the
>absolutely absymal manual supplied with the program. It seems to be a
>cut-and-paste job using the Super-Compact manuals as a source and it
>suffers accordingly.

Yes, the ARRL Radio Designer manuals were based on the Super-Compact manuals--as was appropriate in keeping costs down--with some value added by yours truly. Writing an entirely new book would have made it impossible to bring the product to market at the asking price and in a reasonable amount of time. For the money and within the constraints of its element library and netlist-based circuit entry, it's a very good RF-circuit simulator--as those interested in using its extant features rather than complaining about its absent features know. ;-D

>I mean really, why is there stuff on time-domain
>analysis in the manual, when the program doesn't have it?

Wes, the time-domain features documented are present and functional. ARD Tech Support can provide you with several example circuits to exercise them. That said, don't expect anything like SPICE; it's still linear, small-signal analysis.

Regards,

David Newkirk, W9VES

It is a manual of two parts. The part that was written specifically for ARRL-RD is an excellent introduction, but it doesn't cover all the available functions. The "reference" part copied from the Super-Compact manual covers all the functions (and more, as Wes says!) but it doesn't explain how to use them.

There is a clear need for a series of Application Notes or FAQ documents to fill this gap.

By the way, what has happened to the ARRL RF-CAD reflector? AFAIK I'm still subscribed, but haven't receved a message for several months.

## 5474. Microwave ovens for ATV

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-20 00:00:00 UTC
From: stoskopf@tri.NET
Message-ID: <349BE7A7.6A33169E@tri.net>
Source record: 88161

Just urban lore, but there was some discussion at one of the VHF meetings some years ago about 3 hams working with microwave ovens for moonbounce. Probably a little loose on shielding while tuning. Word was that one or two of them developed brain tumors. The other ceased the attempt.

Power is power. Your eyes (or the holes for them) become waveguides somewhere up there.

As always, careful, careful.

Try adding a voltage regulator, like a LM317. And a metal cabinet.
Or get an FM-25 (?).

> Also, has anybody figured out who makes the chip? or better yet, know
>of a source for more and data sheets?

Rohm, a japanese manufacturer. The BA1404 is now discontinued.
But a couple of distributors still sell it. Ramsey and DC Electronics,
as I remember.

There's been at least one scanned copy of the datasheet on the web,
I found it from a pointer in alt.radio.pirate several years back.
It's pretty sparse. It's also in a book with the grand and phony
title (as I remember it) of, "International Encyclopedia of Integrated
Circuits" by Stan Gibilisco, published by TAB circa 1987-1989.

More information may be had out of various magazine project articles.
One in Radio-Electronics/Electronics Now, July 1992. Also the FM-10
was project article in Popular Electronics a couple of years later.
( both http://www.gernsback.com). Another source would be Don
Lancaster's columns for various magazines. Try http://www.tinaja.com.

The input/output transformer specs are in the 1997 Handbook. They've
been there for 25 years. There is an article in QST in (I believe)
1980 called "Build this Solid-State Titan," authored by Helge
Granberg (SK), that details a simple broadbanded push-pull
two-transistor HF amp. This design appeared in the 1981 Handbook
and some later editions as well. Your most significant change
to the plans is to convert from a TO-8 pinout LM723 to a
DIP LM723. This is a trivial change. You may want to device
a COR for the amp. This is also trivial.

Because this amp could be mis-used for Class D service (you will
see EXACTLY this layout on every chicken-band amp you ever open up),
I am not going to give you more specific references than this.
You have to do enough work on your own.

But I'll give you a hint -- most TV sets built after 1970 have
a balun core on the 300-to-75 ohm UHF tuner input that is PERFECT
for the input transformer, and you can stack three to five Amidon
cores on each side of the output transformer (use a suitable
permeability) if you cannot locate the correct Stackpole cores
specified in Granberg's article.

And if you can't build, there are several sources on the net to BUY
these amps. Their disclaimer says something like "for ISM usage
only." Again,you have to do your own research but the information
is easily accessible.

>
> --
> John Marlow G1ORP

Once you get the encoder disc built, you may find the following snippet
of code useful (I wrote it to interpret the output of a tuning-dial
shaft encoder salvaged from an old Icom rig):

```
//
// Shaft-encoder state table for 95S-1 tuning
//

int shaft_rotation[] = { 0, 3, 1, 2 };

#define ROTATE_NONE 0
#define ROTATE_CW 1
#define ROTATE_CCW 2

...

//
// Check for dial rotation
//

static unsigned char
shaft_state,last_shaft_state,input,rotate,last_rotate;

rotate = ROTATE_NONE;

input = inp(in_port);

shaft_state = shaft_rotation[((input & 0x80) >> 6)
|
((input & 0x20) >> 5)];

if ((shaft_state != last_shaft_state) &&
(last_shaft_state != 0xff))
{
if (((shaft_state == 0) && (last_shaft_state == 1)) ||
((shaft_state == 1) && (last_shaft_state == 2)) ||
((shaft_state == 2) && (last_shaft_state == 3)) ||
((shaft_state == 3) && (last_shaft_state == 0)))
```

```
{
rotate = ROTATE_CCW;
}
else
{
rotate = ROTATE_CW;
}

if (last_rotate != rotate)
{
last_rotate = rotate;
rotate = ROTATE_NONE;
}

++pulse_count;
}

last_shaft_state = shaft_state;

...
```

"pulse_count" is incremented when the disc turns either way. You can use this to gauge the speed of rotation with a simple timing loop (i.e., see how many pulses you get per 18.2 Hz timer tick on the PC, by reading the timer count at segment 0, offset 0x46c). "rotate" is set to ROTATE_CW, ROTATE_CCW, or ROTATE_NONE. The code is set up to respond only on successive pulses in the same direction, to provide some additional immunity to vibration and jitter.

This particular shaft encoder is hooked up to my PC via the parallel printer port, whose data port is at "in_port". Bits 7 and 5 receive the I and Q signals from the shaft encoder in my code above, corresponding to pins 11 and 12 on the parallel port connector. You'll have to adapt this part of the code to whatever interface scheme you use for your anemometer disc.

Well, now, we can rule out a whole gob of those for a solid state
circuit can't we?
>

> Please, when you ref the handbook, give us a clue about what year,

Good gracious, guys. If you don't see one with a single 2N2222a or
MPF-102 or something, and there's a circuit in whatever version you have
that uses an op amp --- then presume you have a functioning cerebral
cortex, use THAT one and don't grumble that I didn't lead you to the
issue, chapter, page, and verse. If you don't have any older Handbooks,
they are worth far more than their typical hamfest used-book-pile cost,
and you can even learn something from them.

But to your point, look at the ARRL Handbook for 1994 (as en example),
Chapter 4, page 21 you will find FOUR suitable circuits using single
transistors for various mic impedances. Newer Handbooks have perfectly
good op amp circuits in them as well -- although they aren't necessarily
"better" in any sense, just apparently more "chic"

From: tinkerman97@usa.net (Tinkerman)
Subject: ## Modifying a radio receiver for High speed digital data reception ##

Hello All,

I'm trying to modify my radio to receive high speed digital data, such
as packet radio. Apparantly, just tapping the discriminator and adding
a data slicer isn't enough. The data comes in as junk, due to phase
distortion by the IF filter. I probably need to replace the IF filter.
Is anyone here experienced in this field and can give a helping hand?
I'm talking about 8000 baud and up (packet is 9600?).
Thank's a bunch for any help offered. Cheers!

6ft! That is nearly 2m long!

> All CB here is SSB/AM, and not FM. There are nowhere near as many FM
> sets here as there are in the UK - any 27 MHz FM set would have to come
> from a CB pirate.

You could get one from the UK, but if you can get an SSB/AM set cheaplyyou can
soon convert it to FM/CW as well. Much simpler than building a transverter.

But still quite manageable for a pedestrian mobile station if you mount
it on a solid hand-carried box that also contains the radio and the
battery. Provided you also use a 2.5m trailing wire for the ground,
there's no reason why a pedestrian mobile station on 10m need be much
less effective than a similar station installed in a car.

You've touched on one of the big problems with hand-held rigs, whether
commercially-made or homebrew. It's hard to attach any sort of decent
antenna on them - the slightest movement of a substantial antenna as one
was walking along would put strain on the antenna connector and a big
antenna with a little radio is mechanically unbalanced and a bit hard to
carry. Better to use a mobile radio, substantial box and a standard
mobile antenna mount for durability. A shoulder strap or handles makes
carrying such a station (though it may be heavier than a hand-held) much
easier than using a hand-held with an antenna of eqivalent efficiency.
The other benefit is the bigger battery possible - 2 or 3 hours of
operating time (at 12w PEP) is no problem for a decent pedestrian mobile
station.

A 6ft whip would be a bit tricky to use on a bus or train. It should be
possible to use a 3 ft whip on board, but it would be less efficient and
I've never done it.

73,

It's 18 Dec 97 18:28,
We'll return to "M.J.Willis and All's
discussion of 2M to 10M Transverter ??

"M> You might find it more convinient to convert an FM CB rig. These have
"M> narrower filters than common 2m rigs to cope with 10 kHz channel
"M> spacing.
"M> They are dirt cheap and you can leave it in the car without having to
"M> worry about it being pinched, though I see you are from Oz where crime
"M> is low anyway.

Only problem is that FM CBs are a tad hard to find here. However, you
could convert an old CB to FM and then tweak it up. I once started on
this, but never finished the project.

... Those who say it can't be done are interrupted by those doing it.

From: "Emil" <emilgborys@worldnet.att.net>
Subject: Alkaline charger designs??

Actually, any alkaline cell can be recharged, however, there is an very
critical "terminal to terminal Vmax" that cannot be exceeded.
Said voltage is not much greater than the no load terminal voltage, and
since dc current flow is resistance/voltage difference, it is not possible
to recharge to origional capacity. If the critical terminal voltage is
exceeded briefly, in the order of hundreds of millivolts, the plastic

lined, heavy steel case, is a necessity.

After the joking of my fellow friends, I'll try to give you a
technical answer: In a word, NO.
I personally own a commercial, specially designed charger for
alkalines from Saitek. It implements a special charging algorithm
(designed to eliminate the need for that plastic lined steel case. I
originally bought it because I had equipment (a palmtop PC) that
required the 1.5V of alkalines and wouldn't work on 1.25V NiCd cells
due to insifficient voltage. Well, I did manage to recharge some but I
never was sure how full they were recharged. What ended the story was
that they started spilling after several recharges, once inside my
scanner (lucky it had a removable - and washable - battery cage, and
that this has not happened in my palmtop!). Conclusion: I won't take
chances anymore, although I've heard there are special rechargable
Alkalines designed for this application with a special charger, all
from Rayovac.
Just my 2 cents...hope that helps.
cheers!

>David Newkirk, W9VES

Well, I should have known this, as I reported this behavior to you and
Dr Rohde almost three years ago. Only, after talking to Dr. Rohde on
the telephone at that time, I thought that he was going to fix this
among other problems with the release of version 1.5.

You should recall that I offered the example of a 3 dB pad that
consists of two shunt 17.6 ohm resistors on the input and output
respectively, with a 292 ohm in series between them.

Radio designer will correctly report an S21 of -3.00 dB, and an S11 of
-71.1 dB. However, it will incorrectly report a MZ11 of 150.3 ohm.
It does indeed magically disconnect the output 50 ohm port to report
the MZ11.

As I pointed out to Dr. Rohde, when I use my HP8510C network analyzer,
to actually measure something such as this, it doesn't disconnect
itself when presenting the magnitude of the input impedance.

When my company spends five figures for RF CAD stuff, its HP/Eesof, so
I can't comment on the "pro" version of Compact.

Of course, most of the blame for the confusion lies with the
absolutely absymal manual supplied with the program. It seems to be a
cut-and-paste job using the Super-Compact manuals as a source and it
suffers accordingly. I mean really, why is there stuff on time-domain
analysis in the manual, when the program doesn't have it?

As far as I no there is no QRP newsgroup, though there are at least two
QRP mailing lists - gqrp-l and qrp-l. There'e also links to a lot of QRP
info through my QRP home page (URL below).

Not necessarily, Scalar network analyzers only measure and
display magnitude, using broad-band detectors. These are commonly used
in conversion systems, such as superheterodyne receivers, where the
output and input are of different frequencies. Measuring phase under
those conditions takes a lot of effort and $$.

The Wiltron 640 is a good example of a scalar analyzer.

For a very nice program do a web search for DTMF_FFT (don't recall the
web page), or email the author emil@interlog.com

here are some details:

DTMF_FFT version 1.00
a DTMF & CTCSS generator and decoder &
a spectrum analyzer program for DOS
Copyright (C) 1996 Philip VanBaren & (C) 1996 Emil Laurentiu
(YO3GGH)

PROGRAM FILES:

DTMF_FFT.EXE is a program for the Soundblater compatible cards.

The program samples the input, performs an FFT, and graphs the output.
It
also decodes and generates DTMF numbers and the sub-audible CTCSS
tones.

INI file and command line options provide the user with the ability to
select linear/log frequency and amplitude scales as well as sampling
rates,
length of the FFT, DTMF generating speed, threshold DTMF and CTCSS
level etc.

You could try using an optocoupler from pin 16, if it requires too much current or voltage, use a small signal transistor with the base on pin 16, and drive the optocoupler from the transistor. On the output of the optocoupler you can use an external power supply to run the relay.

Input/output power levels?

The 1997 ARRL Handbook has a big 'un on p. 13.29, and a smaller
6-meter amp that could be padded down to 10 meters on p. 13.38.

I think Motorola Application Notes EB-63, AN-762, and AN-758
are still in print. These will light your fire -- all these
designs are adaptable to nearly any NPN RF transistor that works
in HF.

I have a stack of amp plans that date back to the 1950s, and
I've kept the ones that are easiest and cheapest to build.
But I won't completely give away all my best secrets.

Try this:
http://www.motorola.com
and search for the application notes. It'll do you good.

From: John Fakan <usscod@en.com>
Subject: 7417 IC Substitute

Hi, John,

The TTL 7417 is a hex buffer/driver. It does not invert so its logic function is trivial. (The 7416 is the inverting version.) Its primary use is simply to buffer an input signal to solid TTL levels.

If you are sure that is what you want just send me an address and I'll send you a few.

John, KB8MU

Subject: Alkaline charger designs??

Guys,

Why reinvent the wheel? The "Renewal" stuff from Ray O Vac works VERY well!
The cells are manufactured a little different, but the the system works! Remember unlike NiCads Renewals like to be charged (No memory). Recharge after each use, NOT when they die. I have some that have been charged over 100 times and going strong. The charger is cheaper than you or I could build anyway. NO steel case, and a nice (LED goes out) indication of when they are charged.

If you are curious about the brass tacks of the deal QEX did a really nice article a while back. Contact the ARRL for more info.

73,
Joe

There may be an easier way to do what you want.

Theres a homebrew anemometer at
http://www.alphalink.com.au/~derekw/ane/anemain.htm
which may be of interest. It reads speed and direction.
It has a serial port, so your computer can read the wind data.

From: Jim Strohm <jstrohm@txeas.net>
Subject: Microwave ATV from a Microwave!!!

I'd be interested to hear the results of your work.

I read that article with some interest, and made some minor
forays into the experiment -- but with the foreknowledge that
it appeared in the APRIL issue, and Wayne Green has been known
to pull some legs.

It's worthy to note that a kilowatt on 2400 MHz is still a kilowatt,
no matter what it began life as. I'm surprised that there's not
more experimentation with microwave oven magnetrons. Seems like
there should be a relatively cost-effective way to provide frequency
stabilization for moonbounce work -- cost-effective relative
to what a TWT or solid-state alternative would cost.

Because of the high power levels involved, I'd be reluctant
to use this much juice for point-to-point terrestrial contacts.
I'm bookmarking your page.

Jim N6OTQ

## 5490. Any advice on filters?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-21 00:00:00 UTC
From: kr4wm@sccoast.net
Message-ID: <MPG.f0725cd13d9db5498968f@news.infoave.net>
Source record: 88078

I'm seeking some advice on rolling my own crystal filters for my new Icom IC-706 Mk II. I spent all my money on the radio, and can't afford the $100 commercial filters. Was I foolish? Perhaps, but I'm enjoying the heck out of the radio! Anyhow, is anyone aware of any technical article on the 'net which would specifically show in detail, but without the technicalities, how to select components, what components are inside, etc. where to connect them inside the radio? There are two accessory filter slots, and I've settled on a 350Hz CW/RTTY filter, and a 1.8KHz SSB filter. What do I need to buy to get something going? I'd like to build a "first class filter". Any info on this subject would be appreciated. I have ARRL handbooks, the Radio Handbook by W6SAI, and QST's dating back to 1980- but as I'm sure any of you would be well aware, the IC-706 Mk II is a new radio, and no filter construction info is available specifically for _this_ radio. Anybody buy one of Icoms factory filters and take it apart to see what's inside? 73, -Web

>12"deep x 5"wide x 8"high, though very solid and heavy). (They came with a
>bunch of other stuff)

Can you tell whether they are linear or switching supplies? A linear
supply will have a large transformer that is most of the weight of
the supply. A switcher will have a much smaller transformer, still
with quite heavy wire for the secondary winding.

From your description of their small size, they're probably switchers.
Keep in mind that switching supplies in general have a *minimum* load
as well as a maximum load. If the current drawn goes below the minimum,
the output voltage may go out of regulation, or the supply may repeatedly
start up and shut down. This may be a problem when powering a transceiver,
since current on receive is so much less than current during full-power
transmit.

Not on Gray Code, but on directions, have you ever noticed that's
what is in your mouse? If a switch gets bouncy and you buy a new
mouse, then you have a pair of small shaft encoders in your old
mouse.

It's a thought.

Probaly the reason they do not work (if you want to jam police radar) is the goverment does not allow intentional jamming of a radio frequency. The Feds have charged some of the manfactures of such devices in court. Would you want your local repeater, local FM radio station, local TV station blocked out of service?????? Only because someone else did not want to hear it? If you do not wnat to be cought speeding slow down.

The same laws that protect thoes services also protect the radar. Think about it.

C.

Message-ID: <01bd0e91$5f815480$75a541ce@cen11212>
Source record: 88091

I am confused why a circuit that would supply 50 amperes would blow a fuse trying to charge a little ol' 68000 ufd cap.... Even if it was at some relatively higher voltages...

Anyway, one possible solution would be to use a 2 stage turn on circuit. One could try using a 1 pole double throw switch that is wired to normally short across a diode that fed one leg of the primary (or secondary, depending on the diode capablities). The idea being to have a diode in series with the primary to limit the actual voltage at the secondary (or vice versa), and then after a short delay, throw the switch to bypass the diode... I'm sure there are people with better ideas out there but this is the first thing to come to mind......

Use a transistor like the 2n2222a to drive a 12 volt relay. connect
a 500 ohm resistor to pin 16 to the base of the transistor, ground the emitter,
connect a 12 volt relay coil from the collector to 12 vdc and a diode
accross the relay coil (bar to the 12 volts). This should work fine.

Ah, you must be talking about the rig colloquially known as the
"Exploder"! A few people I know have one. It was published in EA
magazine towards the end of 1983 - maybe October or November 1983 - the
article was spread over 3 or 4 issues I think. Then there's the related
"Commander" (for 2 metres), that came out a bit later.

There have been various mods in other magazines to fix the TX and/or RX
audio quality. If I recall correctly, one such article appeared in
Amateur Radio mag around 1990.

Can someone direct me to a list of modifications to the Heath SB220 Anplifier?

I believe that around 5 years ago, QST had an article on modifications (mainly mods to "beef" it up) but I cannot locate it.

Any help would be appreciated.

73, Harry, W3IIT

## 5507. Relay contact ratings

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-22 00:00:00 UTC
From: Jeff Anderson <jeffa@ix.netcom.com>
Message-ID: <67lq88$fpb@sjx-ixn5.ix.netcom.com>
Source record: 88095

I recently picked up some inexpensive RF relays (BNC connectors)
and would like to use them as part of a remote antenna
switching network. Unfortunately, I don't know their contact
ratings. Does anyone know how to determine this by, say,
measuring the air gap or contact size?

Thanks,

- Jeff, WA6AHL

I'd like to know where can I have info on buildin' a 2 mtrs transmitter
sending TLM (temp, curr, volt) like the ones on LeoSats for educaional
purposes. Try to imagine a beacon sending TLM not on Sat but on mountain
(solar cells) or top roof of buildings.
The TLM should be CW or 1200bps packet, easy decoded with simple software.
If you know TLM from RS and Dove sats you know what I mean..
Thanks for your attention !

Then the power supply diodes will act as the fuse. :-(

What's needed is a step start circuit. The discharged filter cap looks like an almost dead short, so you have to limit inrush current or you'll blow fuses, or diodes, or both. In smaller supplies, the transformer acts as the inrush limiter, but if you have a hefty transformer, that doesn't happen.

The circuit I use on brute force 12 VDC supplies is a 100 watt light bulb in series with the transformer primary. The NO contacts of a 12 volt relay bridge the lamp socket. The coil of the relay goes across the output bleeder resistor of the supply. At turn on, the lamp glows brightly, limiting current inrush to the transformer. As the cap charges, inrush current diminishes and the bulb grows dimmer. In a couple of seconds, the cap has charged enough that the pull in voltage of the relay is reached. It then shorts out the lamp and allows the supply to furnish full rated current to a load.

## 5521. Simple relay circuit needed: more info

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-22 00:00:00 UTC
From: annen@execpc.com
Message-ID: <882856146.310706186@dejanews.com>
Source record: 88109

I have played with the IC and the pinouts all week end and have come to the conclusion that my approach is all worng. No matter what I attach to the squelch input, it drops the voltage to the point where the squelch is ALWAYS open. The audio mute pin, disappointingly, does not actually have a voltage. So I am going to have to forget about simply hooking up a transistor to this output. I just wish it was that easy. Furthermore, the audio mute pin is connected to the squelch input internally, so if I have anything that is hooked up externally, that too yeilds the squelch useless. I am lost. If someone can help me, look at the info on the MC3359 at the lookup area at motorola's webpage

http://www.design-net.com/cgi-bin/dlsrch

and try to help me make some sense of the IC. One more thought: There is a retail product called the "Nite Logger" that can do this too, but for a $70 price tag. All hookups are done externally through the Speaker and mic jacks. A lot of bells and whistles come along with the unit like a tape jack remote, audio level fine tuning, a cute box,etc. that I dont need. Can something be made externally that could be hooked up to the speaker jack, and when audio comes from the jack when the receiver is unsquelched, will be passed through to the mic input plug?

Here is what I have discovered through external connections. I tried hooking up a voltmeter to the speaker jack, but got no reading. Then I thought, maybe I need to have a load at the other end, so I hooked up the other end to the mic input. With a signal present at the receiver, I had to manually key the PTT on the radio, but heard an extremely distorted signal. Someone suggested I hook up a 470k resistor in series with the mic to drop the level of the incoming signal. while that worked, I still had to manually key the PTT. But the whole thing worked even better when I hooked a 2.2k ohm resistor parallel with the line. Then the audio signal was perfect, and the radio keys up on it's own, but it always stays on, even with no audio signal present. the scematic design for an external mic hookup as shown in the HT manual shows the mic element with the PTT switch as a simple SPST switch in series with the negative side of the mic element (does polarity matter?) connected to the neg. of the mic in. On the positive side is shown mic positive, then further down a 2.2k ohm resistor in parallel across the + and -, then a small value capacitor also across the + and -, ending with a connetion to the mic + input. What I need to do is design a circuit that will replace the SPST switch in the external mic hook up schematic (transisotr, relay, whatever is needed I don't know) and sense that audio is breaking the squelch. I suppose what i really need is a good book, but if someone has seen such a design or can help, please do so. Matt Annen KB9OIV

The mute pin is a current sink, not a voltage source. Use a PNP
transistor and connect its base to pin 16 via a 10k resistor to avoid
loading the mute pin. This transistor can drive a low current reed
relay to do PTT for you.

Reading about S-Parameters and wondering what I'm missing ...

Is S-Parameter analysis primarily used and UHF/microwave frequencies?
Or is it also useful in the 1.8 to 30 Mhz region?

I got the impression it's the former from the HP tutorial. Perhaps
reactive components of transistors are nearly negligible in the HF
region?

Regards,

Nick, WA5BDU

Nick:

S-parameters came about because the common at the time parameters that were used were the h-parameters and y-parameters. These are defined (and were tested) with various terminals either open or short circuited. As the cutoff frequency of the active devices went up, they would frequently break into oscillation when open or short circuited. Since s-parameters are tested with the input and output at 50 Ohms, the devices could be measured.

Once you have the data, it makes no difference which design method you use.

73,

Brooke

MFJ 1274 packet TNC with original box, docs, cables, set for Kenwood radios in like new condition. Also a really nifty, very high tech terminal. It's a Microterm 5520. It is composed of a flat screen monitor and a keyboard. It has a built-in cmos which you enter with a keystroke where you can change literally a couple of dozen perameters. Unless you want to download something (??), a computer is not necessary. This works just great and can be left on at all times (has built in screen saver). Both for $85. I Need schematic and/or Instructions for Morse keyer with dash-dot/dot-dash
memory.
Recently I've built a keyer using cmos IC but it is a bit inconvenient
because it has no
dot-dash memory.
Any helpful information( including schmatics, WEB links, ... E.T.C.) would
be appreciated.
Thanks,

Lee, DS5IPL

>> I could use some help with a Gray code disc please. IE How to make one
>> and then to read it into a pc.

Do you want to know how to make one physically, or just the pattern of a
gray code disc? I can help with the latter but not the mechanics of a
complete encoder. Converting from Gray to Binary is is quite simple and
Binary to Gray even more so. What resolution do you need? 8 bits will
give 1.4 degrees, is that sufficiently accurate?

Hello Bert,

I am happy to report that my Smith Chart program is about to be
upgraded to include a screen plot of the impedance points ( and to
printer). I hope to have it finished today, but in any case keep
checking for SC release 2 on my Web site. The current version does all
the necessary calculations but doesn't present the results
graphically. It's all freeware and is a Windows program.

<snip>

Hello--
I dimly recall seeing such a modification some years ago. It used bidirectional CMOS switch ICs (such as the CD4016) controlled by a computer interface. Each switch section connected across a contact on the keypad. By activating the proper sequence of switches, you could enter frequencies, alter the scanning limits and thus remotely control the radio.

The article may have appeared in Elektor magazine (a European publication that was once available in the U.S.) in the late 1980s. The project looked relatively complex, and given the risks inherent in tearing into the ICF2001's crowded circuitry, you would do well to purchase a service manual for the 2001 first.

Along the same thread, I recently purchased a Packard-Bell FM radio card at a computer show. My intent is to modify the front-end tuned circuits and reprogram the frequency range. This inexpensive card uses a TEA5712T synthesizer IC (I think)-- has anyone experimented with mods for thi IC?

Your best bet for simplicity would be the 8044 keyer chip. The latest
ARRL handbook has a good schematic. Do a search on YAHOO or Alta Vista for
8044. There are about 50 links as I recall.

Nicholas R Kennedy <nkenned@entergy.com> wrote:

>Is S-Parameter analysis primarily used and UHF/microwave frequencies?
>Or is it also useful in the 1.8 to 30 Mhz region?

S-parameter analysis *is* primarily used at VHF/UHF/microwave--mainly because that's where most of the military/commercial action is nowadays. S-parameter analysis is quite useful in the MF/HF range as well.

>I got the impression it's the former from the HP tutorial. Perhaps
>reactive components of transistors are nearly negligible in the HF
>region?

It's not so much that the reactive components of transistors are nearly negligible at HF (I'd say that they can be less important at HF), its that Y- and Z-parameter modeling and parameter extraction techniques can work acceptably well at HF. Further, although it may seem paradoxical, S parameters can be tougher to measure accurately and usefully for real networks at MF/HF because directional couplers with the very high directivity necessary for making the measurements aren't as practical to build for MF/HF. This, combined with the fact that most of the military/commercial design action occurs at VHF and above, means that you'll rarely see manufacturer-supplied device S parameters for frequencies below 50 or 100 MHz.

One approach to obtaining valid MF/HF S parameters for a device characterized at VHF+ works as follows. The required ingredients are S (or Y or Z) parameters for the device and an RF CAD program that (a) allows you characterize a two-port "black box" element with your S (or Y or Z) parameters, (b) does optimization, and (c) includes a generic, realistic model for the device type in question (say, a bipolar junction transistor). By "generic," I mean that the model lets you fill in values for its various Rs, Ls, Cs, gain, etc--if only the manufacturer's data sheet gave them!

Operating in the program, you set up one circuit that characterizes a two-port black-box element with your S (or Y or Z) parameters, and you set up another circuit containing only the generic device model. You make the device model's parameters appropriately optimizable. You set up the program's optimization facility to carry out this order: "Program, adjust the parameters of this model to make the its S parameters equal those of that two-port as closely as possible." And then you tell the optimizer to go.

The result, if you've set up everything properly, is a device model with realistic Rs, Ls and Cs (and beta and F/T\ and so on)--a model the electrical behavior of which mirrors the S-parameter performance of the two-port black-box at the frequencies represented in the S-parameter dataset. The neat thing is that you can then validly use the optimized device model at frequencies outside

those represented in the dataset that characterized the black box--especially at frequencies *lower* than those represented in the dataset. If you the device's S (or Y or Z) parameters at those frequencies, you just set it up as a two-port, analyze it, and tell the program to report the parameters you want.

The "Exploring RF" columns available in PDF form via the ARRL Radio Designer home page (http://www.arrl.org/ard/) include a discussion of this technique.

Regards,

David Newkirk, W9VES

SPICE models are frequently available for components. It's possible and practical to set up a SPICE analysis which will extract the S-parameters at any set of small-signal operating conditions and any frequency range desired. I used this method for a transistor used in a recent consulting job, operating at about 6 GHz. Using S-parameters extracted from the manufacturer's SPICE model gave results much closer to measured circuit performance than the manufacturer's S-parameter values did. (The two disagreed significantly.) I'd generally expect the S-parameter values to be much better than the SPICE model at this frequency, but it certainly wasn't so in this case.

Nope... Three phase is three phase. Your shack has single phase. Won't work. Usually three phase AC is only available in industrial areas. Three phase AC has three 'hot' wires, each 120 degrees phase shifted. The voltage between ANY two is 208 volts. While running it with single phase 220 v might get some output, it surely won't have anywhere near full output capacity.

>So if I tie the outputs of two in series and crank the voltage up to 6 or
>6 1/2v (there's a voltage adjustment slot), I could end up with usable
>12-13v at 200a?
I've heard of people doing this. It can work.

>What's the potential downside as a shack supply?
They are switching supplies, with all the usual upsides and downsides to them. Mostly, the downside is that since they switch, they will likely generate RFI.

Hope this is helpful.

Hi, Alex
What is your DVM/multi-meter doing?
Which way current flows? And electron flows? Current is from Anode to
Cathode which is Arrow to vertical line; Electron flows the other way.
Figure out what polarity your DVM/Multi-meter test leads have and then
you are set. You can figure out diodes, transistors, etc.

I have an old R-2000 SW reciever that I have hooked up to a long wire antenna stretched between two trees in my backyard. Currently I can only receive the big stations; ie, BBC, Radio Australia, etc. Does anyone have an idea as to how I can DX with this setup?

The antenna is tapped at the end with a 75ohm coax which I have run to my receiver. It is the RS SW antenna kit everyone says is too expensive... I had to buy two. One I used for the receiver antenna, the other is the ground. I sank a 6 foot copper rod in the earth outside my window (yes, I can see the Earth from my window) for the ground and attatched the copper wire to it for a ground line.

Does anyone have any suggestions?
Any help will be appreciated.
Kevin

# 5558. Re: New S-Parameter Thread

Newsgroup: rec.radio.amateur.homebrew

From: silvio@joker.irb.hr
Message-ID: <67tioh$o0r@bagan.srce.hr>
Source record: 88047

Nicholas R Kennedy (nkenned@entergy.com) wrote:
: Reading about S-Parameters and wondering what I'm missing ...

: Is S-Parameter analysis primarily used and UHF/microwave frequencies?
: Or is it also useful in the 1.8 to 30 Mhz region?

S parameters were introduced because it was imposible to measure voltages
and currents on very high frequencies. In S parameter analysis one deals
with travelling waves rather than voltages or currents.

My impression is that on low frequencies it is a lot easier to use
traditional Z and Y models and on UHF and microwave freqs to use S
parameter analysis.

: I got the impression it's the former from the HP tutorial. Perhaps
: reactive components of transistors are nearly negligible in the HF
: region?

No, it's just that S parameters are hard to measure on low frequencies.
And it is a lot easyer to use Z and Y models of a transistor. If you really
want to use S parameters you can calculate them from Z,Y and h parameter
matrix.

I got an old Motorola UHF rig the MCX100 and i would like to change it's channel frequencies. Problem is that i dont know what PLL synth chip is on the PLL board since it has a nonstandard marking (77M37). There is a 82s131 (512x4 PROM) on board, i have read it's contents but couldn't figure out what the numbers mean (maybe i was reading it the wrong way, i'm not even sure about it's pinout).

Any help regarding synthesizer chip and PROM would be appreciated.

I like to remember it as:

the bar on the diagram is a minus sign, and that end
of the diode is the negative terminal.

ditto for the actual component. the band is a minus sign.
connect that end to minus (unless you intentionally need
it reverse biased).

I am looking for some information on how to build a keying circuit to use the audio output of one radio to key another radio and retransmit the audio. Sort of like a cross band radio does only I am going to use two diffrent radio. Spacifically I am using an HTX-202 for the reciever and an HTX-404 as the transmiter.

Any information you might have would be helpful. Please E-Mail them to brad@dialnet.net

Thank You.

A lot of the RTTY etc is wideshift RTTY from commercial stations. I have tried QRP on 30. I think there is just too much noise there. Though the Hams are limited to 100W, the commercial stations are not.

Thought of trying 17 meters? Not many stations there, and the band only opens in the afternoon, but if anybody is listening you will be heard over the noise. Also the antenna will be smaller. I would like to see this band used just a little bit more...

Call Howard W Sams Inc. at 1-800-428-7267. They sell schematics for a living. I have been getting them since the early '60s. They will mail you what you want for around $25.00 I believe that is correct. Check the highvoltage transformer, that is probaly where you are having problems as it sets us all of the voltages for the set and it fails often.

Dear All,
Does anyone know what was used for the thin bit of cord that connected bimetallic strip RF ammeters to the needle. For those who don't know what I'm talking about, early RF ammeters consisted of a bimetalic strip that would deform when a current passed through it. The centre of the strip was then connected to a needle using a cord that wrapped around the shaft of the needle so forming a pulley.

I have one where the cord is broken. What can I use to replace it?.

FTV is a software only package that can be used to receive images from
Weather
Satellites and Terrestrial Facsimile Stations, text transmissions from radio
telex services, Morse code, as well as Amateur Radio FAX, SSTV, RTTY and CW
signals. It can also transmit Amateur Radio FAX and SSTV. No external
hardware, other than a radio, is required, as all the necessary signal
processing is implemented in software.

The main features include:
WEFAX, FAX, SSTV, colour SSTV, RTTY and CW operation.
Transmits 6 FAX modes, 8 monochrome SSTV modes, 10 colour SSTV modes.
FAX operation supports APT signal recognition and scheduled reception.
No external decoder or converter box is required.
Signal analysis is provided on all modes.
Many parameters are adjustable while receiving.
Full recovery from wrong mode settings is possible.
Program works in real time (about 1 second 'DSP' time lag)

I have improved documentation considerably and an illustrated user's manual
is now
available. You may get more information or download a copy from my web site,
on http://www.geocities.com/SiliconValley/2504

# 5574. AL-80 Amplifier help

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-26 00:00:00 UTC
From: w8pu@aol.com
Message-ID: <19971226201201.PAA25243@ladder02.news.aol.com>
Source record: 87973

I purchased an older Ameritron amplifier a few years ago; the fore runner of the Al-80B made today. The amp uses a single 3-500Z, 160 thru 15 meters and a pi tank circuit consisting of a 250 pf plate tuning capacitor and a three section 1100 pf load capacitor. 400 pf of capacitance is switched parallel to the tuning capacitor and two silver micas which total 2300 pf are switched parallel to the loading for 160 meters only. For 80 meters 700 pf total is paralleled with the load capacitor and for 40 meters 200 pf. The amplifier has never tuned properly on 160 or 40 and barely on 80 meters. There is insufficient loading. Advancing the load control on these bands causes an increase in plate current but loss of RF power. Maximum output occurs with the load capacitor fully meshed. Power output is between 700 and 800 watts depending on drive; 65 to 90 watts. There is approx 2450 volts on the plate under load. I have been over every inch of the amp and went so far as to verify componet values and even swapped out the tank coils. The only solution has been to increase the loading capacitance by installing larger door knob capacitors. Currently the total capacitance is:

160 meters tune 650 pf load 4100 pf
80 meters 250 1800
40 meters 250 1300

I dont know what the load resistance of the 3-500z is so I cant verify these values against the ARRL handbook. 160 meters still wont load properly. Paralelling another 1000 pf will begin to help. How much is too much?
On top of this mess the bandswitch capacitor has damaged contacts due to arcing. The contacts are too close for the 160 meter tuning capacitance switching and the rest of the contacts used for the other bands. I guess it's no wonder Ameritron redesigned this amp. Any suggestions?

Source record: 87977

The least expensive effective way to go is to use the sound card. The HamCom interface is a very basic system which, while inexpensive, will never compare in performance with a decent TNC. A simple interface is a good way to get introduced to digital modes, but I'd never suggest that better than, or even equivalent to, a good decoder circuit such as is contained in the Hal, SCS, or other TNCs.

# 5579. Re: Hamcomm and AMTOR

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-26 00:00:00 UTC
From: Al Williams <alw@al-williams.com>
Message-ID: <uMi0tMnE9GA.346@nih2naab.prod2.compuserve.com>
Source record: 87978

Wow! What a can of worms. I agree that PACTOR should be writable, but I hate to reinvent the wheel and have to write the spectrum functions etc. The HAMCOMM software works really well (and yes I am registered), and I probably would not have time to redo it as well.

Sure a TNC is great, but for what I use it for HAMCOMM is great. Sound card stuff? Fine, but I doubt that is much better than HAMCOMM and I haven't seen any that are as inexpensive as HAMCOMM and do PACTOR. Besides, I get a kick out of using something I built, not just something I cabled to my PC. With good filtering HAMCOMM is a very good performer.

Anyway, I never started this thread to suggest that TNCs are no good or bad or that even HAMCOMM is their equal. On the other hand, I have to wonder if I am the only ham using HAMCOMM! Surely there are those of us who would like to use AMTOR and as you point out for what I do it is perfectly fine and better than RTTY.

From: kr4wm@sccoast.net
Message-ID: <MPG.f0e4379d9cdc601989693@news.infoave.net>
Source record: 87979

Looking for design parameters for a filter to be used in an Icom 706 Mk II. Spent all I had on the radio, now I'm being cheap on the filters. Would like to design/build a 350 Hz CW filter, and 1.9 KHz SSB filter for it. Total budget about $20. Any ideas how to design/build them would be appreciated. A done-deal schematic would be even better. I see them in the ARRL handbook, but no parts values are stated, nor are there instructions on how to determine the values needed. I found some info on the 'net that stated 2k ohm input and output Z. Don't know the IF frequency where these things go- Am I wasting my time? Should I just go ahead and save my pennies until I can buy factory filters? 73, -Web

>receive QST and I'm not "really" interested in kits.

Thanks.
Charlie
>Shaw
KB3BTO

My favorites are:

***W1FB QRP Notebook, by the late Doug DeMaw, published by ARRL
If I could reccomend ONE book and one book only to the homebrew-curious, this
would be it. The first "rig" I ever built was a 1 transistor (2N2222)
mighty-mite, which I used with a radio shack SWL reciever. We're talking BASIC
radio here! Many circuits are covered here that allow building of fairly
complex little radios using a modular design pproach.
***QRP CLASSICS published by ARRL
This is a compilation of solid state QRP projects from several years of QST and
the Handbook. A wide range of complete construction projecs is covered here,
from basic 2 transistor transmitter to multiband superhet transcievers. A lot
of station accessories are presented as well.
***Solid State Design For the Radio Amateur published by ARRL
A good primer on basic RF design for those who want to design their rig rather
than use the "cookbook" method. starts simple but is fairly comprehensive as a
whole. Heavy reading at times for the neophyte... take it in small bites
***Radio Receiver Projects You Can Build by Homer L Davidson, published by Tab
Press/McGraw Hill
Very entertaining book. I have had a lot of fun building some of the projects
in this book, especially the vacuum tube recievers. Very basic stuff here...
starts out with crystal sets and goes through TRF, regen, direct conversion,
and VERY simple AM superhets. Mostly oriented toward AM Medium wave broadcast
and shortwave AM recievers, though there is an add-onn BFO project that allows
SSB and CW reception by many of the featured projects. 1920's through 80's
technology presented. Gets into coil winding, building simple tuning
capacitors, using ICs, power requirements and options, varactor tuning, xtal
"pulling", etc Parts called for, even the tubes (1S4, 3S4, and 12AT7) are

cheap and not hard to get. GREAT book for kids. Not really ham-oriented, but radio is radio. My favorite!

Hope this list has been helpful. Have fun. Keep your iron tinned and hot!

There seems to be no reason the HAMCOMM style interface could not be used on PACTOR All that is needed is for somebody to write the software for "in-the-computer" processing of the data stream. The protocols are published, and don't seem to be that much more complicated than AMTOR. Maybe DL5YEC will work on a PACTOR upgrade to his HAMCOMM program if all the unregistered shareware users out there would register.
The HAMCOMM circuit is a really clever little device and can easily be built into a D-sub hood. Full-featured TNCs are needed for some things, but not for informal ragchews. Why spend $400 on a TNC when the HAMCOMM circuit can be built for less than $20? or bought for under $50? Phooey on TNC's! By the way, the device works with several other SSTV and FAX programs, notably JVFAX.
As far as AMTOR being "not good enough", the question that comes to my mind is: "not good enough for what?" For casual ragchewing, Amtor is great! Throughput is still generally faster than I cah type, so why do I need to go faster? I don't like to send canned messages except to forward them. During a ragchew, I think it is rude to send canned stuff other than a VERY SHORT "brag file". Therefore, AMTOR and RTTY are "fast enough" for me. Now, since AMTOR has pretty decent error handling, I would tend to favor it over RTTY most of the time.
Note that HAMCOMM also does a fair job with high-speed CW if the code is sent clean and steady with no swing. You can also key your rig with the program if you build the keying feature into the interface. This would seem to make HAMCOMM/JVFAX/Hamcomm interface the ideal all-around package for the digital ragchewer. With Pactor included, We would be looking at a really neat package indeed.
whew! that got a bit long. 73 evrbody

The above works if you are trying to remember how to forward bias a diode.

I have seen many old diodes marked with a plus on the cathode; I've seen a few new ones also. Selenium rectifiers were marked this way too as are bridge rectifiers.

I believe diodes were marked this way to indicate where the positive voltage would be when the diode was used in a power supply. The cathode end is the positive supply and would be connected to the positive terminal of a filter capacitor.

Dave

Yeow! $13K is a lot of peanuts! May I suggest Circad? It also
has a free demo that lets you build little stuff. The good news
is that a full package is available to Hams (Must be at your
Flying Horse Call book address) at reduced price. $1000.00
normal price for Hams only $295.95!

It does Schematic and PCB but not simulation directly.

Check out the demo on Ci$ GO HAMNET or www.holophase.com
If anyone wants in on the Ham discount get in touch with me
directly. I do the sales / support for it.

Wow! Selenium rectifiers! I've still got a few of those things in the
junk box. Now that was a COMPONENT! With all that space, they had plenty
of room to add labels.

>

I always figured the "arrow" pointed in the direction the current was
supposed to flow, and I never really knew why they put the "minus signs"
on diodes. Of course, even the EE courses couldn't get me used to
thinking about current being opposite in direction from the electron
flow, so I invented some of my own ways of remembering these things.

Electrons are real, aren't they? ;-)

I mean, there aren't any positive charges flowing through the wires.
And holes are merely places where the atoms would like to have an
electron, but they're not truly positive charges.

Rich

Web: I think you can build a filter yourself. It would be a good project and would make that new ICOM less of an appliance! You'd be one of the very few people who have dared to venture inside one of those radios with a soldering iron. Go for it!

You REALLY need the articles that are reprinted in the ARRL book "W1FB's Design Notebook" :

May 1982 QST " A unified approach to the design of Crystal ladder filters" by Wes Hayward

July 1987 QST "Designing and building simple Crystal filters" also by WH

Jan 1990 QST " A tester for crystal F, Q and R" by Doug DeMaw.

I have a homebrew CW filter in my HB receiver. Works great!

73 and good luck. Bill N2CQR

RF sensing T/R switches usually use a small capacitor in series with
a resistor to tap off a small amount of the RF signal. The signal is
detected with a diode and used to run a transistor which runs the relay.

To change sensitivity, make the series capacitor a little larger or
the series resistor a little smaller. Just remember that the amp has
about 10 db of gain, so you will get 3-4 watts out.

# 5597. Re: Hamcomm and AMTOR

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-27 00:00:00 UTC
From: rcrusoe@aol.com
Message-ID: <19971227174401.MAA01796@ladder02.news.aol.com>
Source record: 87987

I'm gonna build myself a new Hamcomm interface sometime this week... I think I got everything I need. Later this coming week I intend to homestead up on 17 meters and I will be running mostly Amtor though I will reply to other modes. All Hamcomm/Amtor ops are welcome. Maybe we can get a nice FEC round-table going on this under-utilized band. If the band does not open up I guess I'll slug it out on 14078 or thereabouts. I might try 30 meters in the evening.
I wouldn't mind using my sound card for AMTOR or even pactor if the software was out there and as cheap as hamcomm or the other shareware programs. It certainly has potential, and I have sound in my Toshiba notebook which is more or less Soundblaster compatible. Of course a lot of hams are still using 286 machines and can't or don't want to mess with a sound card.
How bout audio DSP filtering with a sound card? What a great CW filter you would have for that old reciever! Not to mention speech processing for SSB. Now that's something the Hamcomm circuit can't do!

# 5598. Re: Hamcomm and AMTOR

There are several sound card CW filter/decoders available in addition to RTTY, Amtor, Pactor, and FAX. Most (if not all) require a true SoundBlaster card.

HELP!!!!
could someone show me what the discription of parts would look like
in schematic form "three components make the hardware:

comparator, PLL and XOR gate. take the discriminator's output from the
scanner tuned on freq and feed it to the op amp, tune the PLL for 10khz
and
run its output and the incoming datastream thrugh the xor. dats it,
after
you do this you should have a bunch of info. "

CRT's. These appear to be new cathode ray tubes, some boxes still sealed. Don't know what type of equipment these were used in. I'm sure some were for oscilloscope use. Others probably some military application. 3BP1 $5.00ea. 3GP1 $5.00 ea. 3FP7 $5.00ea. 5BP1 $7.00ea. 5FP7 $7.00ea.
Buy now at listed price or wait until 1/7 /98 & bid on it at eBay Auction by going to
http://trig.ebay.com/aw/ & do a search. Price listed does not include shipping from Baltimore, Md.
Thanks for taking the time to check this out.
John
UPDATE
Here's what I have left (I sold so many that I probably won't bother listing the remaining ones with eBay) 4-3BP1@$5.00EA, 3-5FP7@ $7.00EA, 4-5BP1 @$7.00EA.
Here are some additional ones that I found as I started digging into the pile. 1 ea of the following: 5CP1 @$7.00, 3JP1@$5.00, 5AXP4 @ $30.00, 7BP7 @$30.00 & 12DP7 @$35.00

Hello all,

I'm looking for schematics and/or printlayouts for following projects :

A solid state amplifier for use in 160 m band, input max 10W output 150W. It's of no use for me to build a KW amplifier, because legal limits are 150W.

A system to switch antenna's when transmitting for the use with a separate receiving antenna for low bands.

All tips or comments are welcome. If possible reply direct to email adress.

73 and tnx in advance.

Erik

Tandy Corp. and Radio Shack has long been known for some good and some bad things. And the HTX 202 is no different.

The 202 HT is a robust unit. Able to withstand some pretty nasty abuse.

But to this day, I have not seen or heard of any type of modifcations to the unit. Tandy and Radio Shack do everything in their technical abilities to re engineer their products so they can not be modified for out of band transmit or receive.

Where you should see about 7 watts out on high with external power, and great rejection of unwanted signals, if you wished to have a wider receive and transmit, you may have wanted a Yueasu, Kenwood or Icom. Even Standard has a good radio.

I sold my unit and for about the same price got the TH 79-ad from Kenwood. Which is a dual band radio.

# 5614. Re: Does anyone know how to design/build a crystal filter?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-27 00:00:00 UTC
From: Michael Black <blackm00@CAM.ORG>
Message-ID: <Pine.GSO.3.94.971227221657.17510B-100000@Stratus.CAM.ORG>
Source record: 88004

Those are the articles I would point someone to. But one problem I see here is getting something compatible with an already existing piece of equipment. If we're building something, we can start with whatever crystals are available in large quantities (which is the way these articles suggest you start; sort through the crystals until you find a set that are close enough in frequency) and then design the rest of the rig around that.

If you want to build a filter that fits in a commercial rig, the chances of finding a large number of crystals on the rig's IF frequency is dependent on the IF frequency. If it's nice and round, say 12 MHz, then it might be relatively easy. Some rigs have fairly odd IF's, and that might be harder. Has anyone made ladder filters with custom ground crystals, ordering the handful that you need at a higher price so they fit the specs needed? I would think that if it's feasible, the cost of the crystals would be more than $20.

Also, given the IF frequency, can you build the width of filter that you want?

Another consideration is the design of the rig. If it uses multiple conversions and narrow filters at those different IF's, there is an even greater need to get the filter right on frequency than if it's a single conversion rig (or a rig where the narrow filter is in only one IF).

Finally, you'll need to get the BFO to be in the right place on the slope of the filter. That means either getting the filter on exactly the right frequency, or having some means of adjusting the BFO.

The easiest way to take care of these problems (and that of matching the impedance of the filter to the rig) would probably be to add two mixers and an oscillator, thus adding to more conversions to the rig. Shift the existing IF to the frequency of your homemade filter, and then shift the output of the filter back to the existing IF.

The problem with this is that the circuitry is not likely to fit into the space provided for a filter, and the extra conversions add problems of their own.

A lot of what we've seen on ladder filters deal with lower performance filters. Even with all the above concerns addressed, I'm not sure someone can throw together a filter that would be better than what already exists in the rig. Thought now that I mention it, I recall that there was an article in Communications Quarterly (I don't recall the issue) that dealt with higher performance ladder filters. That is

probably another place to look before pursuing this project.

This sounds rather pessimistic. I think that is realistic. But maybe it
will provoke some discussion about this topic.

# 5616. Re: Center Frequency of Crystal IF Filters

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-28 00:00:00 UTC
From: n2ey@aol.com
Message-ID: <19971228181900.NAA07451@ladder01.news.aol.com>
Source record: 87922

Hello Ron,

The offset depends on the type of filter. To generalize, ladder filters typically use the parallel resonant mode, so the offset should not be too bad, but lattice filters use the series resonant mode, and the offset may be several kHz. Add to this the fact that the marked xtal frequency may be for a load capacitance that is very different from the capacitance found in the filter.

I'd suggest thinking about a slightly more complex counter design that would work regardless of the offset. Here are some ideas:

1) Depending on the mixing scheme used, you could have a "multi-interval" counter that would count both the LO and the BFO, then display the total. For example, if the mixing scheme is 14 MHz (signal) - 5 MHz (LO) = 9 MHz (IF), you could set up a counter that first counts the LO, then (without resetting) counts the BFO, and then displays the result. The error will only be the receive offset - the display will show the zero beat frequency. If it's set up to read the transmitter carrier oscillator on transmit, there will be no error at all on transmit. If the mixing scheme is subtractive, you need a counter with up/down capability, but they are fairly common.

2) If you just want to count the tunable LO, you can use a presettable counter to take out the error. An example is the TTL 74192 and its cousins. This is a presettable up/down counter that works up to at least 20 MHz. I've found selected units that easily work at 35 MHz. The preset can be set with dipswitches, and all you do is tune in a known signal and play with the dipswitch settings until the dial reads correctly.

Also, you can combine the above ideas to make a truly universal digital dial/general purpose counter. There were several articles in QST on these ideas back in the '70s - I can look them up if needed.

Hope this helps.

> of the amateur bands. For some reasons they chose not to...

It's an engineering decision - which do you want, a well-behaved intermod-proof receiver, or wideband receive capability that crumbles within a kilometer of every paging transmitter? The HTX-202's tight front end makes it the former receiver; it does exactly what it's supposed to do, and there is no point in criticising it because it doesn't do things it was never designed to do.

Since the tight front end precludes out-of-band operation (you *did* look at the schematic in the manual, didn't you?), what else do you want your HTX-202 to do?

If you really want out-of-band capability, buy a scanner. They're cheap.

Message-ID: <19971228211101.QAA23985@ladder02.news.aol.com>
Source record: 87924

OOPS! Sorry guys... I drew the diagram for "poorman.gif", which is a schematic for a Hamcomm-type interface, from memory... and my memory was faulty. There is one glaring error in the schematic. The PTT keying circuit ties into the RTS line, not the DTR line as drawn. The error will cause the PTT to key on SPACE and release on MARK. Hardly the desired effect! Connect the anode of the diode to the RTS line and not the DTR line. Also, as you might suspect from his little tidbit of information, direct FSK keying is possible using this pin, for radios that can utilize direct FSK

Another thing I forgot... very important... If you go for broke and build an interface with all features including CW keying, you must make provision for disconnecting the PTT line from the interface to your rig during a CW QSO, or lose QSK. Furthermore, you should also disconnect the CW KEY line from the rig during a RTTY or AMTOR QSO, or else you will be treated to your sidetone keying on and off with the SPACE bits, if your sidetone can still be keyed in SSB mode. I accomplish this with mini inline jacks and plugs, but you could use a miniature DPST switch on the pc board, I guess.

I have corrected the graphic file..... on my computer. Frankly, I am rather embarrassed about the error, and I have not posted the corrected version. If anybody tells me they are interested in it I will post... otherwise, I'll just keep skulking about in my utter shame like a thoroughly whipped puppy.

By the way, if anybody downloaded it, could you please e-mail me and tell me how it came out? That is the first graphics file I have posted. It seemed OK when I downloaded it, but I want to be sure that everybody else could get at it.

I hope nobody built that dern thing last night and incorporated my error into the device, only to find out it don't work. Did anybody etch a PC board by any chance? Double shame on me.

Radio Shack has an excellent 1/4-watt assortment these days. I think
you get 200 or 300 or so for $4.99, something like that anyway.

## 5621. 900 Mhz mod or transverter????

Date: 1997-12-28 00:00:00 UTC
From: w r taylor <richardtaylor@worldnet.att.net>
Message-ID: <687boi$3tt@bgtnsc03.worldnet.att.net>
Source record: 87927

I am looking for a radio mod or transverter information to operate on the
902-928 MHz ham band.

Is there commercial radios that can be modified to operate on 900Mhz?

Where is a source for information on this equipment?

Richard Taylor

# 5622. Index Labs QRP+ Info - Mods?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-28 00:00:00 UTC
From: Scott Gray <comm5@pacbell.net>
Message-ID: <34A7438B.1FFD7B25@pacbell.net>
Source record: 87928
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I just purchased a Index Labs QRP+ CW/SSB transceiver - this is a NICE little rig!

I've got a bunch of questions; EPROM version; what the last version released? The rig powers up and shows it's serial # 0512. Inside the RF PCB is labeled 1050. U9 PROM has 4C 512 labeled on it, while U8 has 1050 marked on it.

The boards reflect the QST review from 9/96 QST (no AF SSB level pot).

Do I have (or even need) the "latest" EPROM version? Does SGC provide any product support? I would sure like a technical shop manual for this rig..

I've read rumblings of a QRP"++"......And a prior version; Index Labs QRP (sans the "+"). Differences?

Meanwhile, I'm going back to the rig, put on some phone's, and get used to this neat little rig.

Wish list??; 2.4 KHz ~~IF~~ bandwidth to be sharper, backlighting (LED's should do fine), RTTY, Packet and PACTOR operation?.SSB "reverse" above 7.3MHz?...."extended" transmit" aka "MARS/CAP" mod??.

Plans? I've got a few 0.4 watt VHF (145.9) GE MASTER II exciter boards for RS-15 (mode "A" etc.) uplinks (clean CW). Ten-Tec 6 Meter X-verter...

Any constructive help from QRP+ owners is greatly appreciated!

But maybe you won't even get that if the amp is biased Class C.
Many amps have a manual keying input you can use. If yours does,
try that and see if you get any useful power out. If you don't, you'll
need to bias the amp for linear operation to get any useful output.

No.. Read the message again..

>Label says Input: 3 phase 208v 3.5a 47-400hz
> or 230v 9.6a 47-60hz

208v is the three-phase value of a 120v (single phase) supply.

In the UK, the inter-phase voltage is (was) 415v, it's probably changed now we've officially dropped from 240v to 230v. It's equal to a single phase-to-neutral voltage multiplied by the square root of 3 (1.732).

I would guess the 3-phase implementation is to keep the current down for U.S. operation.

The 1st thing that normally happens (I'm assuming it's a switch-mode PSU) is the incoming AC is rectified before being chopped. Therefore the only front-end difference should be the rectifier arrangement. Looking at the label it looks like you should be able to run from a domestic UK 230v supply, though you may have to change some links to reconfigure the input.

The comment about minimum load is a valid one, especially for 'biggies' like those.

(to the original poster)
Don't forget, what you read here is only supposition, based on your original posted text. It's up to you at the end of the day to look & decide whether to plug it in & cringe! I would suggest you try to borrow a variac & wind it up monitoring the input current. Don't forget an o/p load - I'd suggest a 10% load e.g. 20A. Oh, and check the house insurance ;o))

Gene,

All in all you where pretty fair to Tandy and RS. I'm sure that the Tandy could re-engineer their products to operate out of the amateur bands. For some reasons they chose not to. In regards to out of band transmit capability, I could agree with the policy. I admit I occasionally miss the Ability of my old Alinco HT's ability to receive the local public safety repeaters, but it's receiver was very poor compared to the htx 202. All in this in IMHO!, it's not my intent to open an old debate!

# 5640. Center Frequency of Crystal IF Filters

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-28 00:00:00 UTC
From: astone@erols.com
Message-ID: <34A6B51D.1A29@erols.com>
Source record: 88021

Hi -- How far off will the actual center frequency of a typical 3-4 crystal Cohn or lattice type IF crystal filter be from the exact nominal value of the crystal -- i.e., 4.0 MHz, 12.0 MHz, etc. -- in a typical NE602 type QRP rig (e.g., SST, 38S, NN1G, etc.). The reason I'm asking is because I am thinking about building a very simple frequency counter to partly serve as an e-dial but it won't have offset capability. Of course, one could mentally peform the offset but it would be nicer to largely avoid this. Would appreciate any insights/data that you might have.

> II. Spent all I had on the radio, now I'm being cheap on the filters.
> Would like to design/build a 350 Hz CW filter, and 1.9 KHz SSB filter for
> it. Total budget about $20.

You will Spend a lot, a very lot of time on building these filters. Twenty dollars may get you something that is 'cheep and cheerfull'. I have just built three QRP SSB (White Mountain) rigs that use an 'novel' approach for their filters. They use four series tuned crystals that are very lightly coupled with 100pf caps to yield about 2.7 KHz bandwidth. The review of that Rig is in a recent QST.

Any ideas how to design/build them would be
> appreciated. A done-deal schematic would be even better. I see them in
> the ARRL handbook, but no parts values are stated, nor are there

>
Get Yourself a Digi-key Catalog or go to http://www.digikey.com and do a parts search for 'crystals' (you will be at http://www.digikey.com/DigiKeySearch.html and if you are using Eudora® you can just double click on the URL). What you want are the microprocessor crystals, as they are very cheap, about one US dollar and change each. See if you can find some on your _EXACT_ IF frequency. If you can you are in luck! Order your $20 worth. You should get about 18, and you will need them all for frequency matching.

You will then have to match them by frequency using a procedure that is explained in detail on the Nor-Cal QRP page (sorry I have not a URL) or a link from there and this kind of filter is used in their Nor-Cal Sierra or 40 rigs. Try http://www.dogpile.com for a search, they are my favorite search engine and send out your request to about twenty plus other search engines. You will then cascade and lightly couple about six of these matched frequency crystals to get your selectivity. More Crystals, More Selectivity. The downside of that is More Selectivity, More Loss. If your rig does not have a provision to compensate for the added loss (or match the loss between the various bandwidth filters as my Paragon does with resistive pads) you will have to add more gain or live with less gain (I.E.

turn up the receive gain/volume when you switch in the narrow filter). Have fun! Let me know how it goes. If all of your $20 worth of crystals are on the same frequency and they are cascaded you will do good to get less that one kilo Hertz selectivity. My Paragon Has, I think eight, crystals in the 250 Hertz filter and has no pad in 'front' of it. The 2.4 KHZ filter has, I think four, crystals in it and is preceded by a 't' pad consisting of 68 ohm input and out put resistors and a 270 ohm resistor to AC ground. This makes for about 6 dB voltage loss assuming 2 K ohm input impedance. The Ten Tec Crystal filters us Parallel resonate crystals. Your results may vary.

Hi Joe , I don't know whether you currently use loose AA batteries or use a purpose built NICAD Battery pack .

If you can replace separate AA batteries I would suggest you get Nickel Metal Hydride batteries ;these have a capacity of 1100 to 1200 mA*HRS
What ever you do ,make sure your Nicad or NiMH pack is provided with a fuse which will blow when short circuiting the pack . The fuse can be made by squeezing a small piece of thin double sided printed circuit board bridged by a wire which will instantly break /melt at a current of approx 5 amps In this way you can avoid the nasty consequences of a fire due to the shorted batteries . All sealed packs with rechargeable batteries have a fuse .

Constructing a single ended amplifier for 10 meter use. The amplifier will be using
a single 811-A with around 1000 plate volts and be class B. Wondering on a tank circuit configuration for this combination. Load and tune capacitor values and coil dimentions. Any help appriciated since I am currently using books from the 1930-40's era for reference.
thanks

You can also try Batteries Plus <www.batteriesplus.com>. They have an enormous supply of all sizes of ni-cads. And most stores can put the tabs on for you at no cost. They will even do a custom pack for you very reasonably. their web-site has a store locator, so you can find the one closest to you.

# 5646. Help : Collins mechanical filter information

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-29 00:00:00 UTC
From: prajna <prajna@hit.co.kr>
Message-ID: <687m85$6to$1@hiline.shinbiro.com>
Source record: 87936

Hi Everybody,
I have 4 Collins mechanical filters which I bought 18 years ago from junk,
and
followings are written on each filters;

```
TYPE SER P/N
---------- ------ ------------
F455 N 20 11 S 2 526 9163 009
F455 N 40 11 S 2 526 9160 009
F455 N 80 10 S 2 526 9161 009
F455 N 160 12 S 2 526 9162 009
```

I have no idea what kind of filters are these, and couldn't find any
information
from http://www.wa3key.com/filters.html.
Can anyone tell me the detailed specification and usage advices of each
filters ?
Can I use one of these as a CW filter with my TS-450S ?
Any help would be appreciated.

Happy New Year 1998!

<direct e-mail to : prajna@hit.co.kr.NO_SPAM or ds5ipl@qsl.net.NO_SPAM>
Please remove ".NO_SPAM" for direct reply.

Thanks.

## 5650. RF front end device

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-29 00:00:00 UTC
From: John Mackesy <mack@melbpc.org.au>
Message-ID: <01bd144e$12c755a0$1f9e0ccb@default>
Source record: 87940
Cross-posted to: aus.electronics,aus.radio.amateur.misc,rec.radio.amateur.homebrew,sci.electronics.equipment

I'm looking for an IC device to act as part of a preselector (with AGC) in front of an HP 312A Selective Voltmeter (wonderful xcvr, no AGC, prone to overload). The device should have the following characteristics:

Operation to 30 Mhz
Single-ended input (L-C circuit)
Positive-going AGC input
50 or 75 ohms output impedance
"Affordable"!

Suggestions really appreciated

John Mackesy VK3XAO

> frame loop so access to the preamp controls isn't a problem.

Normally, you *want* the preamp and tuning capacitor to be inside a shielded box, with the lead length between the preamp circuit and tuning capacitor as short as possible. The preamp box should also be located right at the loop, so that you do not have to use long leads. Long leads can affect the pattern of the loop, and will also reduce the tuning range because of added capacitance.

Good grief! The thing is a piece of test equipment and you completely destroy
it's intended function with AGC!
The IF is fixed gain (within the range of the attenuators) and expecting 120 dB
of AGC just by controlling feedback to a preselector is expecting a whole lot.
If you just want a receiver, go buy a lousy little continuous coverage radio
and save the 312 for the shop. (If you can run across the companion 313
tracking generator, you REALLY have a piece of test gear!)

# 5655. RE: How to build a crystal filter for an Icom 706 Mk II

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-29 00:00:00 UTC
From: kr4wm@sccoast.net
Message-ID: <MPG.f11a3c2659c002989697@news.infoave.net>
Source record: 87945

OK, now I know MUCH more than I did to start with. I now see that it would take some substantial engineering to learn:

The IF frequency (which I believe to be 9.016 MHz)
The filter input impedance (which I have found to be 2000 ohms)
The filter output impedance (which I have found to be 2000 ohms)
A supplier of crystals on that frequency.
How to match the input and output impedances.
Make sure the components are small enough to fit in the space alloted.
Find some way to calculate the loss using the available components.
Make sure the frequency of the filter "fits" into the passband desired.
Make sure the crystals are close-tolerance?
Lots of other mumbo-jumbo that I don't understand nor care to learn.

In other words, it's going to be better for me to simply accept that unless I'm building up a receiver from scratch (thereby being able to casually experiment with filter components) and considering the cost of this radio is fairly high. Further considering that the space inside this Icom 706 Mk II would require a filter of miniature proportions, I'm better off to let Icom do the engineering for me, and just buy what they sell.

I appreciate all the input I have received from you and many others.

Yes, it is possible, but whether it is practical is another story.

Such a device could consist of a direct conversion receiver hokked up to a small FM transmitter. It would be easier to use an FM broadcast receiver instead of a HT as you'd be able to use an FM bug kit for the transmitter. Otherwise you'd have to build a low power 2m transmitter (though in this case a single xtal osc on a submultiple of 2m would be OK) and that's more expensive due to the need for an xtal or synthesiser.

Overall, you'd be better off making an audio amp for your DC receiver than feeding low level audio into a VHF transmitter that you'd have to build.

# 5659. ## Is anyone using the RadioShack "ProbeScope" and willing to share his experience? ##

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-29 00:00:00 UTC
From: tinkerman97@usa.net
Message-ID: <ELyx24.K0I@news2.new-york.net>
Source record: 87949
Cross-posted to: alt.comp.hardware.homebuilt,alt.comp.hardware.pc-homebuilt,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,sci.electronics.equipment

Hello friends,

I'm looking for a lowcost, portable and small osciloscope for simple debuging applications. Although very basic in functionality, the RadioShack "ProbeScope" seems like the ideal tool for what I'm looking for, because:

1. It has a mini display for portable operation.

2. Can be interfaced to a PC for a larger display.

3. Sample rate (20MHz) is about right. The low vertical resultion (6 bits), limited input range and even the tiny 128 buffer depth all seem to be bearable.

It's almost a toy compared to the professionals, but for what I need and considering it's size and cost, I find no better alternative.

Since Radio Shack are not responding to my technical questions in a reasonable time. I need other users help. What I'd like to know is:

1. Is the PC display mode good enough to be useful in the lab for simple tasks (the LCD defenitely isn't, it's too tiny)? Has anyone got a screen capture that he can send via email?

2. Is there any s/w out there that can provide longer sampling intervals or improved functionality?

3. Can the bundled DOS s/w run on an XT class machine (I want to run it on my palmtop!)? Although RS state a minimal CPU requirement of a 386, the other requirements can be met by a simple PC (DOS 3.3, 600K RAM, etc. If not, is there any 3rd party DOS s/w that can do it?

4. Is it still sold at RS and if so, at what price?

5. Most important: are there any QUIRKS I should be aware of about this product?...:-)

Thanks in advance for any help offered.

## Note: when Replying, please email me directly in addition to posting here, so no responses are missed. Don't forget to remove the "97" from my email address inserted as an anti-spam counter measure...:-)

Thanks and best regards,
Tinkerman

## 5662. SB-200 mods?

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-29 00:00:00 UTC
From: LA8AK@la8ak.nospam
Message-ID: <34a6e5b8.72610@news.online.no>
Source record: 87952

Thanks for the mod.info about SB-220. SM3BIU/Basse requests particular
modification references for SB-200. Some of those for SB-220 might
apply for SB-200?

Build your own cable descrambler. Very simple to build. I have a program
on 3 1/2 floppy disk that will give you the parts list schematics and
step by step instructions.
E-mail me today to order your copy.

Cost of disk
US $1.00
Outside US $2.00

# 5664. Re: Three 5v 200a Supplies - Verify Info?

Bloody dry English humor! Kills me ... guess that's why it's called
"bloody"? :-)

I have a 230VAC line meter coming in the mail soon, and am going to run a
#10
4-wire line from the breaker panel box to the shack (keep the neutral
floating).

I will see if I can borrow a variac from a friend across town.

I guess I can use a couple of car headlights as the initial test load.
(Wonder if
my neighbor will mind if I borrow them from his new truck ... no, never
mind.)

Actually, if the devices provide for either type input (3 phase or straight
230), I
should be OK ... but just in case I'll test when the wife and kiddies are
out!

The homeowners and life insurance are paid up and a fire extinguisher
(required
equipment for every 'real' ham ... read: 'tinkerer') is at hand and fully
charged!

And yes, I know, translating your initial sentence "...your mileage may
vary..."

:-) 73, DavidC AA1FA

# 5665. fs: Variable Air Inductor Assembly

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-29 00:00:00 UTC
From: DavidC <davidc@bit-net.com>
Message-ID: <01bd14ab$0615d860$0d8a92d0@bitnet.bit-net.com>
Source record: 87955

I just dug out an inductor I forgot I had! It is a combo tapped and partially variable inductor for high power, and of a neat design - could find use in a remote or a base ant. tuner setup.

32 turns of silver #10-12 (guess) coil 3" x 5" long attached on the outside to four 7" phenolic bars. On one end the coil enlarges a bit and there is a rotating coil inside of it to provide some variability.

This rotating coil is connected to a drive system that was once driven by a motor (the switch is on the assembly), but may also be shaft driven.

The multiple taps on the coil go to a high power capacity ceramic switch with 5 positions.

A bonus of 8 doorknob capacitors of varying value are also on the assembly ( I noted the following color codes, grn-blk-blk-wht, and grn-blk-purple-blue). I'm told the doorknobs sell for $4. each.

The whole assembly is neat just to look at, but would make more sense in a functional application. Asking $45. shipped CONUS.

Will consider trade or trade plus cash. Looking for a Soundblaster board to use with digital modes (needs to be the model that has dsp), also looking for a high quality coax switch (good to full power +), and may be needing a complete Collinns R-390A manual set (if a deal to buy one happens). Other offers considered.

73, DavidC AA1FA

I have the following transformers for sale:

1. Paeco #4026

Primary: 115/230 V 50-1000 Hz
Secondaries: 920 V center tapped at 100 mA
6.3 V at 8 A
6.3 V at 8 A
6.3 V at 8 A
6.3 V at 8 A
6.3 V at 6 A
5 V at 2 A

2. Paeco

Primary: 115/230 V 50-1000 Hz
Secondary: 960 V center tapped at 500 mA

Both transformers were removed from HP test equipment. They have heavy duty solder terminal strips and schematics with pinouts.

I'm located in southeast Pennsylvania. Please make offer, if interested.

**********

Sua:

The most "usable" reference I could give you is "Reference Data for Radio Engineers" published by Howard Sams - somewhat commonly referred to as "The Blue Brain" when it was blue. It contains, along with a wealth of other useful information, a relatively easy-to-use design technique for helical resonators. There is also a book published by, I believe, Aertech, whose title and author I forget, which is devoted to helical resonators. It is good, but undoubtedly more detail than you need.

I can give you a few pointers that will get you on your way. The length of the spiral "winding" is roughly 1/4 wavelengths (in free space) shortened by roughly 5 to 10 % to give room for tuning. They are actually 1/4-wavelength resonators. The length to diameter ratio of the "winding" should be ROUGHLY 2:1. Conductor spacing should be ROUGHLY one to two wire diameters and the enclosure diameter (assuming a cylindrical enclosure) should be ROUGHLY twice the "winding" diameter. The "winding" is centered in the enclosure with the bottom "grounded" to the enclosure. The top is tuned with a SMALL variable capacitor. Now to the hard part: matching and coupling. I have had best luck by coupling the resonators with a piece of insulated heavy conductor, like that used to "wind" the resonator. Coupling is controlled by spacing between this conductor and the tops of the individual resonators. I have NOT had good luck with aperature coupling in designing large resonators (using 3" to 6" copper pipe as the enclosures). I have had best luck input/output coupling from/to 50+/-j0 ohms by tapping up 1/4 to 1/2 turn from the cold ("grounded") end to a BNC connector soldered to the side of the resonator enclosure. I have not used probe coupling

with much success. CAUTION: to do a good and responsible job of coupling and matching helical resonators really does require use of a vector network analyzer. However, good results can be had with care in measurement. I have always used the vector net. an. to optimize my designs. Even the book published by Aertech admits that is the best method. Design of helical resonators is largely emperical. However, don't let that scare you off. The helical resonator is a much underrated and underutilized (and maligned) filter.

Hi Ryan, I saw that another person replied as to the whys... I am wondering if you have the formula for your xtal selections.. something like [ f - (if)] /12 for RX or f/9 TX etc..

If the formula for selecting your frequency is a comon one, I should have the crystal you need for the cost of postage. Possibly others as well.

Jim, KB6ZOP

K.R.
My name is micah

I'm looking to also to do a single side band DSP based receiver.
A couple of books that might help are
"Digital Signal Processing in Communication Systems" by Marvin Frerking
ISBN 0-442-01616-6
"Single sideband systems and circuits" edited by William E. Sabin
(this second title may be slightly incorrect, but Sabin did edit this
book) this second book also includes some of Frerkings info from the
Frerking book.

To do this I intend on using Analog Devices DSP processors. I intend on
using 200 Ksamples/second (subsampling a higher IF) A/D converter,
connected to two ADSP processors, linked serially. I am doing it for a
class in college.
Frerkings book has block diagrams and probably sufficient information to
make at least a good attempt at it.

The frequencies I was going to try was going to be below 1 MHz, but I
can't find enough information out there about where any active
frequencies, so I am thinking about targeting w1aw for use as a test
signal for reception.
Unfortunately I don't know if it is SSB or AM.

If you have more information on signals that are transmitted on a
regular basis that are SSB, I'd appreciate it if you would let me know.

If you would like to work together on this, drop me a line.

NOTE: make sure the Email address is "micahw@bellsouth.net", I'm not
sure the reply address is setup properly in my mail program.

# 5678. Crystal Filters

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-30 00:00:00 UTC
From: wmeara@erols.com
Message-ID: <34a916ab.251269901@news.erols.com>
Source record: 87962

We've been talking about crystal filters...

I have here about ten "mystery filters" that might prove useful in Homebrew projects.

I picked them up at the (soon to be defunct) EEB store in Vienna Virginia.

They come packaged in very sturdy little 1 inch by 2 inch metal boxes.

Four crystals in the inside, Looks like some form of latice arrangement.

Three terminals: In, Out, Ground.

I put a scope and a signal generator on the and found the resonant frequency to be around 2.250 Mhz. I don't have the gear to do an accurate measurement of bandwith.

They are marked "Hermes Crystal filter" and were made by Itek Electro-Products of Cambridge Mass.

Anyone know about these devices? Anyone want to do some tests on one of them? Anyone need one?

# 5679. Icom U12 conversion help????

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-30 00:00:00 UTC
From: miker <&miker@ethergate.com>
Message-ID: <34A8E7EB.5BD8@ethergate.com>
Source record: 87963
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur,rec.radio.amateur.homebrew

I acquired a small pile of high-band Icom U12 handheld transceivers and decided
to convert two of them into a portable repeater.
Got the frequency conversion to 449MHz. done, but can only get 1.7W at 11 Volts.
Spec sez 3W at 10.8V. No, I don't have an unconverted one that works left to try.

The manual shows same parts in the high and low band versions.
None of the tuning caps are maxed out. Poked around the coils with a tuning stick. Could make it worse, but not better. Even took out the T/R
switch. Gained a little.

Exact same output on two units, although the DC current drain was 600ma on one
vs 900ma on the other.

Hard to believe the 1mhz difference (449 vs 450) is costing me that much power.
Any ideas on getting the power up to 3W. I need all I can get. Yeah, I'll put
a bigger heat sink on the final.

Advice?
thanks, miker
Please remove & from return address before replying.

HI David OM,

Your inductor/capacitor/switch assembly comes from a WW II military
surplus antenna tuner. I have one identical to it.
The rotating link provides for variable coupling to the inductor. Handy
for making a single-ended (coax) antenna tuner.

73,
Don, W6JL

Hi Mark OM,

Have you looked in any ARRL handbook? Simple limiter-discriminator demodulators have been described in many books and magazines over the past few decades. They work well, and are basically identical architecture to those in the PK232, KAM, etc. I would not recommend using a simple phase-locked loop type of demodulator on HF; very poor performance.

Use your local library to find ARRL handbooks; don't buy one just to find a single piece of information. For the cost of one handbook you can build yourself an RTTY modem.

GL and 73,
Don, W6JL

>
>ryan a t poboxes d o t com
Hi Ryan,
It is unusual but not unknown to not have a rx adjustment for your
crystal. Yes, crystals do drift due to ageing. Bearing in mind that the
actual crystal frequency will be considerably lower than 146.48, a small
change here will be proportionately larger at the operating frequency.

The reason you have different Tx and Rx crystals is because they employ
a different mixing/multiplication chain to reach the final frequency.
As I said earlier, your rx crystal will not be at 146 MHz but something
much lower in frequency, possibly around 15 MHz or thereabouts.

If you quote the equipment model along with the wanted final frequency
to most reputable crystal manufacturers, they will more than likely
know what crystal to provide. The cost is cheap (in the UK around 7
UKP) it is not worth trying to find one here.

Does any body have pinout for a 4CX600J. It has the same base as a 4CX250 series. Need to know which pins are the filament, grid, and screen grid. Also want to know fialment voltage and current.

Thinking of using one in 6 meter amp.

In the mid-seventies, I homebrewed a ham-band receiver using KVG 9 MHz crystal filters for ssb (model XF9-B) and cw (XF9-M). At the time,I could have cared less about AM. Now that AM is springing back from the grave, however, I'd like to add the KVG AM filter to my receiver. Does anybody know whether (a) KVG is still in business, (b) whether they make an AM filter, and (c) what the model number is? If anybody has a filter to sell, I'd be enormously grateful. I'd also be enormously amazed. Thanks.

>Jim McVein
>jimm@teleport.com

I used some Siemens, Wandel&Goltermann and HP selective voltmeters at
work - normally within 0.5kHz-10MHz. I believe the main problem is
lack of front-end selectivity. You usually use them to adjust single
tone levels or look for spurious signals, so overload is no problem
when used as specified and 20dB dynamic range.
An easy way to improve them is to build a simple PRE-SELECTOR
circuit consisting of at least one, or better two tuned circuits.

A similar problem is with Collins 51-S when used below 2MHz

What test leads do I need for my Heath IO-4540 Scope, please?

I have acquired this scope and hope to learn with it. I have most of the manual, but no info about what test leads are appropriate.

Anyone familiar with this thing and can offer advice?

BTW: I do have a bnc inline "Neg DC Out, Telonic Berkeley, Crystal Detector, Model 8551, .1 - 1500 mHz 3v max." device. Is this somehow useful with the scope? (I'm guessing it would rectify RF so it could be viewed?)

The '97 ARRL handbook has this info in it. There is an article called "A Trio of Transceiver/Computer Interfaces". It has a Kenwood IF box and 2 others (Yaesu and Icom). Would make great comparison.

The Yaesu and Icom boxes are nearly identical. The Yaesu interface is just a 3 wire (TX, RX, GND) RS232 level converter using a MAX232 and some buffering (7417).

The Kenwood uses RTS/CTS handshaking and the polarity is backwards. This makes it easy to optoisolate the thing and that's what the handbook's plan calls for. Other than that, the circuit is just a MAX232 level converter, but you have to convert RTS/CTS also.

Hope that helps. You can find a brief description of the handbook and all that at http://ourworld.compuserve.com/homepages/Al_Williams/book.htm

Scott,

A great way to get started is to use a simple HAMCOMM interface and a PC. HAMCOMM is a program writtend by DL5YEC and it is shareware, so you can try it before you buy it. The interface you need is just an op-amp from Radio Shack and a few bucks worth of parts (ordinary diodes, capacitors, and resistors). Everything you need you could pick up at Radio Shack. I built my first one on a prototype board in 10 minutes with junk I had laying around. The construction is not critical and there is no complicated tune up required.

The interface works with several packages, but HAMCOMM is probably the best of them. It does RTTY, ASCII, and AMTOR. If you buy the registered copy (I did) it does PACTOR receive too. The tuning indicators are great and the software is really flexible. You can also use it with JVFAX to do SSTV (send and rec).

You can also buy HAMCOMM interfaces built already, but they are so simple, there isn't a great reason for doing so unless you want a nice case and are a mechanical klutz like I am.

The circuit is just a zero-crossing detector that connects to the serial port and generates interrupts. The software counts the interrupts and analyzes the frequency information that way.

There is a great page about HAMCOMM run by an American ham, but I can't remember the URL. However, if you go to my page, you'll find plenty of references to HAMCOMM and every one of them will link to his page. He has an improved schematic (takes only a few extra parts), and sells finished units. He also has the software for free download (remember, it is shareware). I don't sell anything related to HAMCOMM, I just think it is great fun!

My page: http://www.al-williams.com/wd5gnr

One warning: HAMCOMM needs sharp filtering. I had built an outboard filter when I had an older rig. Now I use a Kenwood TS570D and its DSP does the job very, very well. Terry's improved version (on the Web site I mentioned) has some passive filtering built in and I don't know how that works because I haven't built one yet.

Another note: HAMCOMM technically copies CW, but that doesn't work well enough to really use for anything serious (at least, not for me). To tell the truth, I have tried writing CW copying software before and it is tough. HAMCOMM does about as well as you'd expect on CW, but that isn't very good.

Now, to abate flames:
1) Yes, HAMCOMM is not as good as your $300 TNC.

2) No, I am not saying that your TNC is not wonderful.
3) Everyone knows that PACTOR is so much better than AMTOR.

All I am saying is that for $10 HAMCOMM is a great way to get into RTTY/TOR and is simple enough that most anyone can have the satisfaction of building some of their own gear and even experimenting with it. Most of us won't cut into a $300 TNC.

Hello Paul
Sorry I lost your original post so I will post this as a response to
Mark's post.
The following is a slightly modified version of an article that I
posted recently for a similar request.
-------------------------
I have the TS-450 rather than the TS-850, but I would be very
surprised if there were any differences in the 6 pin connector ACC-1.

In fact, the User's Data for the IF-232C, itself, says that it is
designed for transceivers capable of computer control, such as the
TS-940S and the TS-811/711 series.

I have used the Kenwood IF-232C External Control Interface with it,
and it works fine.

Here's the pinout per my data sheets:

1 Signal Ground
2 Transmit Data (Output) (TXD)
3 Receive Data (Input) (RXD)
4 Transmit Enable (Input) (CTS)
5 Receive enable (Output) (RTS)
6 N/C
Note that the meaning of "Transmit" and "Output" refer to signals from
the transceiver to the PC.

The data sheet also indicates that whereas the PC's serial port is
RS-232C (-12v to + 12v), the Transceiver uses TTL (0 to +5). I guess
that explains why it is you can't just connect the two ports directly
together - Hi.

One other point of interest. As is the case with almost all RS-232 devices, remember that the connection between the Transceiver and the PC MUST connect Transmit Data to Receive Data and vice versa. Likewise the CTS/RTS lines are also cross connected. Well, that's consistent, isn't it?

Don't forget which pins are which on the PC side. Depending on whether you have a 9 pin or 25 pin connector, as follows:

Signal 9pin 25pin

TXD 3 2
RXD 2 3
CTS 8 5
RTS 7 4
GND 5 7

I should point out that the IF-232C unit uses a 4 circuit Opto-isolator chip, a power regulator chip, and two chips for line driver/conversion functions. It does a great job with a cable length of 100 feet, so I'm satisfied that it is noise free. I can't remember for sure what software I used but there were two shareware programs that work fine, and I got them from the QRZ CD-ROM.

If there's anything else you need, don't be bashful.
---
P.S. I have used two different shareware programs with this interface over a 100' cable and it works fine.

Unfortunately it isn't exactly the same base as the 4CX250 series. The
4CX600J uses the SK607 which includes a contact for pin 5, missing from
other SK600-series bases.

Also the pinout is different - the center pin is a heater contact and
the grid pin is somewhere around the edge!

---

Assuming you have the RF ATT knob set to 0, the R2000 should be pretty sensitive. I have an old one I bought new back in the early '80s and it's been a real workhorse. I have it on a nightstand next to my bed and it puts me to sleep every night. :-)

There is one problem with the R2000 however: The digital circuitry radiates a bunch of hash which will be picked up if your antenna is just a bare wire connected to the terminal in back. Perhaps this is what is covering up the weak signals. A much better approach is to use an ordinary dipole fed with coax. The coax does two things: It shields the input in the immediate area of the radio and it gets the actual receiving wire (the dipole) away from the radio. A double benefit.

This hash problem is the only serious fault the radio has, other than a tendency toward intermod if you are near any strong local stations. That can be overcome with a tuner if it's a problem. Like I say, I've had mine for about 15 years now and it's one of the most-used pieces of equipment I have. Incidentally, the battery for the memory was only supposed to last a few years but mine's still going strong. Good luck.

73, Bill W7TI

# 5705. TS-50S computer control

Newsgroup: rec.radio.amateur.homebrew
Date: 1997-12-31 00:00:00 UTC
From: rcrusoe@aol.com
Message-ID: <19971231182100.NAA21796@ladder02.news.aol.com>

Anybody know anything about homebrewing a computer control interface for the TS-50S? I like this little rig and I use it for SWL as well as hamming. It would be really nice to be able to peck out a frequency on the keyboard instead of twirling the knob, ur using the up/down buttons on the mic which Is usually lost somewhere in my junk closet.

Also, any info on writing a control program in VB 3.0 would be appreciated. I have written several nice programs in VB and I am familiar with most of the built-in resources, but I have never written anything that sends/recieves data via the serial port. I would really like to write a program that would have the features I want with no dead weight. Ideally I would combine logging, callbook,SWL scheduling, control, CW/RTTY/FAX, and QSL printing in a single program that can run in the background, and that would still display all the important stuff in a reduced window. Most of the features would just be front-ends for other existing programs, since speed is not of the essence here, but the port I/O I would have to write the code for, I think.

I know there is a factory built device for this rig, but I want to build.

I know there is a factory supplied program for this rig, but I want to write.

Thanks in advance to a great group for answers to either question.

Down east microwave are doing chassis and kits for a 6m amp using 2 x
4CX400 - reasonable priced I believe, their at www.downeastmicrowave.com

How 'long' is the long wire? A "short" long wire fed with a "long"
piece of coax is not a Good Thing.

Hello- I am not a Ham, but I figured if anyone can tell me where to locate an esoteric part, you guys could.
The problem? I have an old Sansui Receiver/Amp model 2000 ( last made in 1969!) and the stereo volume control has a 250K linear taper dual gang pot with loudness taps, 3/8" mounting and 1/4 " shaft about 1 inch long. One of the wipers is bad, and I am having the devil of a time finding a component that'll fit.
If any of you guys know of a book, magazine or journal that advertises hard to find parts that you homebrew folks use, please let me know.
Thanx and hope to hear from one of you soon!
Happy New year too!
Dan'l

I'm posting this here for the benifit of others who may perhaps be
looking for the same thing. Try "Dan's small parts", here's the URL;

http://www.fix.net/~jparker/dans.html

He not only has lots of good parts, but keeps a very good stock and is very
prompt at filling orders.

(no affilliation, just a very satisfied customer)

Check between 53.01 and 53.99 outputs.....Inputs are -1MHz...
I know there is ONE Indy machine...used to work it from near
Houston a few years ago.....Dont recall the actual freq though.
check in the ARRL RPTR Directory...

Robin, try John's website at http://www.apci.net/~jbi/
John offers an interface kit that was very positively reviewed in 73
magazine. He includes a disk with rig control and logging software.
